Bk1—17 to 20 inches (43 to 51 cm); brown (10YR 5/3) sandy loam, dark brown (10YR 3/3) moist; 17 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; many very fine and common fine tubular pores; 2 percent medium spherical carbonate masses; strongly effervescent; moderately alkaline, pH 8.2 by Hellige-Truog; clear wavy boundary.

Bk2—20 to 33 inches (51 to 84 cm); pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; 15 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine and few medium tubular pores; 2 percent medium spherical carbonate masses; slightly effervescent; moderately alkaline, pH 8.2 by Hellige-Truog; clear wavy boundary.

C—33 to 44 inches (84 to 112 cm); pale brown (10YR 6/3) sandy loam, dark brown (10YR 3/3) moist; 14 percent clay; moderate fine and medium subangular blocky structure; very friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine tubular pores; moderately alkaline, pH 8.2 by Hellige-Truog; abrupt wavy boundary.
2Cd—44 to 60 inches (112 to 152 cm); densic material; massive; noncemented.

Type location: Butte County, California; about 5.7 miles southwest of Gridley, approximately 175 feet north and 150 feet west of the southeast corner of sec. 13, T. 17 N., R. 1 E.; 39 degrees, 19 minutes, 7 seconds north latitude and 121 degrees, 47 minutes, 53 seconds west longitude; NAD27; USGS Quad: Pennington, California.

Range in Characteristics

The depth to densic material ranges from 20 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from about June 15 to October 31 (about 138 days). The particle-size control section averages 10 to 18 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 2 percent to a depth of 17 inches (43 cm). A fluctuating water table can occur between the top of the densic material and 11 inches (28 cm) below the surface of the soil from December through April. Some pedons do not have a C horizon.

The A horizon has dry color of 10YR 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 2/2, 3/1, 3/2, or 3/3. Texture is sandy loam, fine sandy loam, or loam. The content of clay ranges from 15 to 23 percent. This horizon is noneffervescent to strongly effervescent. Carbonates are disseminated. Reaction ranges from neutral to strongly alkaline.

The Ak horizon has dry color of 10YR 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 3/1, 3/2, or 3/3. Texture is sandy loam or loam. The content of clay ranges from 15 to 25 percent. This horizon is slightly effervescent to violently effervescent. Carbonates are disseminated. Reaction ranges from slightly alkaline to strongly alkaline.

The Bk horizon has dry color of 10YR 5/3, 6/2, 6/3, 6/4, or 7/2. Moist color is 10YR 3/3, 4/2, 4/3, or 4/4. The content of clay ranges from 12 to 27 percent. Texture is sandy loam or loam. This horizon is slightly effervescent to violently effervescent. Carbonates are commonly disseminated and may occur as spherical carbonate masses. Reaction ranges from slightly alkaline to strongly alkaline.

The C horizon, where it occurs, has dry color of 10YR 6/2, 6/3, 7/2, or 7/3. Moist color is 10YR 3/3, 4/2, 4/6, or 5/3. Texture is sandy loam or loamy sand. The content of clay ranges from 12 to 20 percent. Reaction is moderately alkaline or strongly alkaline.

Campbellhills Series

The Campbellhills series consists of deep, somewhat poorly drained soils that formed in residuum weathered from basalt. These soils are in joint fractures on the top of basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Ultic Argixerolls

Typical Pedon

Campbellhills gravelly loam, on a west-facing slope of 2 percent, under a cover of annual grasses, at an elevation of 380 feet (116 m). When described on 4/28/1997, the soil was dry to a depth of 39 inches (99 cm) and moist from 39 to 50 inches (99 to 127 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (10YR 5/3) gravelly loam, dark brown (7.5YR 3/2) moist; 15 percent clay; moderate thick platy structure parting to weak very fine subangular blocky; slightly hard, very friable, nonsticky, slightly plastic; many very fine roots; many very fine irregular pores; 25 percent strong brown (7.5YR 4/6 moist) oxidized iron masses; 10 percent basalt cobbles and 15 percent basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 7 inches (5 to 18 cm); brown (10YR 5/3) gravelly loam, dark brown (7.5YR 3/2) moist; 18 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine roots; common very fine tubular pores; 20 percent clay films on faces of peds and in pores; 25 percent basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt wavy boundary.

Bt2—7 to 17 inches (18 to 43 cm); brown (10YR 4/3) very gravelly clay loam, dark brown (7.5YR 3/2) moist; 30 percent clay; moderate fine subangular blocky structure; hard, firm, moderately sticky, slightly plastic; common very fine roots; many very fine tubular pores; 30 percent clay films on faces of peds and in pores; 40 percent basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt3—17 to 29 inches (43 to 74 cm); brown (10YR 4/3) very gravelly clay loam, brown (7.5YR 4/2) moist; 33 percent clay; moderate fine subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine roots; many very fine tubular pores; 40 percent clay films on faces of peds and in pores; 5 percent basalt cobbles and 50 percent basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt4—29 to 39 inches (74 to 99 cm); brown (7.5YR 4/3) extremely gravelly clay loam, dark brown (7.5YR 3/2) moist; 36 percent clay; moderate fine subangular blocky structure; hard, very firm, moderately sticky, moderately plastic; few very fine roots; common very fine tubular pores; 50 percent clay films on faces of peds and in pores; 10 percent basalt cobbles and 55 percent basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt5—39 to 50 inches (99 to 127 cm); brown (10YR 5/3) extremely gravelly clay loam, brown (7.5YR 4/2) moist; 38 percent clay; moderate fine subangular blocky structure; hard, very firm, moderately sticky, moderately plastic; few very fine roots; common very fine tubular pores; 60 percent clay films on faces of peds and in pores; 20 percent basalt cobbles; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

R—50 inches (127 cm); lithic basalt with weathering rind.

Type location: Butte County, California; about 3.1 miles northwest of Oroville, approximately 1,650 feet east and 550 feet south of the northwest corner of sec. 10, T. 19 N., R. 3 E.; 39 degrees, 31 minutes, 20.9 seconds north latitude and 121 degrees, 37 minutes, 37.9 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from May to about November (about 150 to 200 days). The particle-size control section averages 20 to 30 percent clay and 40 to 55 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. By sum of cations, base saturation ranges from 35 to 40 percent. By ammonium acetate, it is 76 to 91 percent. A fluctuating water table can occur between the top of the bedrock and 3 inches (8 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 10 to 25 percent gravel and 0 to 30 percent cobbles.

The A horizon has dry color of 7.5YR 3/3, 4/4, or 6/4 or 10YR 3/3, 4/3, or 4/4. Moist color is 7.5YR 2/2, 3/2, 3/3, or 4/3 or 10YR 2/2 or 3/2. Texture is loam, gravelly loam,

or cobbly loam. The content of clay ranges from 15 to 22 percent. The horizon has 10 to 20 percent gravel and 0 to 15 percent cobbles. The content of organic matter is 4 to 8 percent. Reaction is moderately acid or slightly acid.

The Bt1 horizon has dry color of 7.5YR 3/3, 3/4, 4/4, or 4/6 or 10YR 3/3, 4/3, or 4/4. Moist color is 7.5YR 2/2, 3/2, 3/3, or 4/3 or 10YR 2/2, 3/2, or 3/3. Texture is cobbly loam, gravelly loam, very gravelly loam, or very cobbly loam. The content of clay ranges from 18 to 27 percent. The horizon has 10 to 30 percent gravel and 0 to 40 cobbles. The content of organic matter is 3 to 6 percent. Reaction is moderately acid or slightly acid.

The Bt2, Bt3, Bt4 and Bt5 horizons have dry colors of 7.5YR 3/4 or 4/3 or 10YR 3/4 or 4/4. Moist color is 7.5YR 3/2 or 3/3 or 10YR 3/2, 3/3, or 3/4. Texture is very gravelly clay loam, very cobbly clay loam, very gravelly loam, very cobbly loam, extremely cobbly loam, extremely cobbly clay loam, or extremely gravelly clay loam. The content of clay ranges from 25 to 40 percent. The content of gravel is 10 to 65 percent, and the content of cobbles is 0 to 50 percent. The content of organic matter is 0.3 to 2 percent. Reaction ranges from moderately acid to neutral.

Carhart Series

The Carhart series consists of moderately deep, poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in basins and drainageways, on toeslopes and footslopes, and in saddles on Cascade foothills. Slopes range from 0 to 12 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Endoaquerts

Typical Pedon

Carhart clay, on a north-facing slope of 3 percent, under a cover of ryegrass, medusahead, lupine, and clover, at an elevation of 282 feet (86 m). When described on 4/24/2001, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 6 cm); gray (7.5YR 5/1) clay, dark gray (7.5YR 4/1) moist; 55 percent clay; strong medium and coarse subangular blocky structure; very rigid, friable, very sticky, very plastic; many very fine roots; many very fine to medium irregular and common very fine and fine tubular pores; neutral, pH 6.8 by Hellige-Truog; gradual smooth boundary.

Bssg1—2 to 12 inches (6 to 30 cm); gray (7.5YR 5/1) clay, dark gray (7.5YR 4/1) moist; 55 percent clay; moderate coarse prismatic structure parting to strong medium and coarse angular blocky; very rigid, friable, very sticky, very plastic; common very fine and fine roots; common very fine and fine irregular and tubular and common medium irregular pores; 20 percent slickensides; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bssg2—12 to 24 inches (30 to 61 cm); gray (7.5YR 5/1) clay, dark gray (7.5YR 4/1) moist; 55 percent clay; strong fine and medium angular blocky structure; very rigid, friable, very sticky, very plastic; common very fine roots; common very fine and fine irregular and tubular pores; 50 percent slickensides; slightly alkaline, pH 7.5 by Hellige-Truog; gradual smooth boundary.

Bssg3—24 to 30 inches (61 to 76 cm); gray (7.5YR 5/1) clay, dark gray (7.5YR 4/1) moist; 55 percent clay; strong fine and medium subangular blocky structure; very rigid, friable, very sticky, very plastic; few very fine roots; few very fine and fine tubular pores; 15 percent slickensides; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

2Crtk—30 inches (76 cm); moderately cemented volcanic sandstone bedrock; 15 percent clay films; 15 percent carbonate masses in cracks; slight effervescence, by HCl, 1 normal; moderately alkaline, pH 8.5 by Hellige-Truog.

Type location: Butte County, California; about 1.1 miles south of the intersection of Durham-Pentz Road and Clark Road, approximately 2,350 feet north and 800 feet east of the southwest corner of sec. 34, T. 21 N., R. 3 E.; 39 degrees, 37 minutes, 55 seconds north latitude and 121 degrees, 38 minutes, 1 second west longitude; NAD83; USGS Quad: Hamlin Canyon, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 60 to 68 degrees F (16 to 20 degrees C). The particle-size control section averages 40 to 59 percent clay and 0 to 10 percent rock fragments, mostly gravel. Mineralogy is smectitic. Reversible, surface-initiated cracks 1 to 2 inches (3 to 5 cm) wide extend to a depth of 20 inches (51 cm) for 200 to 250 days when the soils are not irrigated. A fluctuating water table can occur between the top of the bedrock and the surface of the soil from December through May. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 5 percent cobbles. Some pedons have Bss and Crq horizons or a gravelly substratum.

The A horizon has dry color of 7.5YR 5/1, 5/2, 6/2, or 6/3 or 10YR 4/1, 5/1, or 6/1. Moist color is 7.5YR 4/1, 4/2, or 3/2; 10YR 3/2 or 4/1; or 5YR 4/1. Texture is clay. The content of clay ranges from 40 to 59 percent. The content of gravel is 0 to 10 percent. Redoximorphic features occur as oxidized iron masses and iron-manganese masses. Reaction is neutral or slightly alkaline.

The Bssg horizon has dry color of 7.5YR 4/1, 4/2, 5/1, 5/2, or 5/3 or 10YR 5/2 or 6/1. Moist color is 7.5YR 4/1 or 4/2 or 10YR 4/1 or 5/1. Texture is clay. The content of clay ranges from 40 to 59 percent. The content of gravel is 0 to 10 percent. Redoximorphic features occur as iron-manganese nodules and a gleyed matrix. Reaction ranges from neutral to strongly alkaline.

Carhart Taxadjunct

The Carhart taxadjunct consists of shallow or moderately deep, poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in basins on strath terraces on Cascade foothills. Slopes range from 0 to 2 percent. The mean annual precipitation is about 27 inches (686 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Clayey, smectitic, thermic, shallow Xeric Endoaquerts

Typical Pedon

Carhart taxadjunct, on a southwest-facing slope of 1 percent, under a cover of soft chess, annual ryegrass, and Mediterranean barley, at an elevation of 515 feet (157 m). When described on 5/12/1998, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 4 inches (0 to 10 cm), dark gray (7.5YR 4/1) clay, brown (7.5YR 4/2) moist; 55 percent clay; strong fine and medium granular structure; very hard, firm, very sticky, very plastic; common fine and many very fine roots; many very fine and fine irregular and tubular pores; 10 percent cobbles; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Bss1—4 to 11 inches (10 to 28 cm); dark gray (7.5YR 4/1) gravelly clay, brown (7.5YR 4/2) moist; 50 percent clay; moderate medium subangular blocky structure; very hard, firm, very sticky, very plastic; few fine and common very fine

roots; common very fine and fine tubular and irregular pores; 10 percent slickensides; 5 percent cobbles and 10 percent gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bss2—11 to 17 inches (28 to 43 cm); dark gray (7.5YR 4/1) clay, brown (7.5YR 4/2) moist; 45 percent clay; moderate medium subangular blocky structure; very hard, firm, very sticky, very plastic; few fine and common very fine roots; common very fine and fine tubular and irregular pores; 10 percent slickensides; 2 percent gravel and 5 percent cobbles; neutral, pH 6.9 by Hellige-Truog; abrupt smooth boundary.

2R—17 inches (43 cm); indurated mudflow breccia bedrock.

Type location: Butte County, California; about 1.65 miles northeast of the intersection of Keefer Road and Cohasset Highway, approximately 590 feet south and 500 feet west of the northeast corner of sec. 14, T. 23 N., R. 1 E.; 39 degrees, 51 minutes, 14 seconds north latitude and 121 degrees, 49 minutes, 35 seconds west longitude; NAD27; USGS Quad: Richardson Springs, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 40 inches (25 to 102 cm). The mean annual soil temperature is 60 to 68 degrees F (16 to 20 degrees C). The soil moisture control section is dry in all parts from about June to November (about 150 days). The particle-size control section averages 40 to 60 percent clay and 5 to 35 percent rock fragments, mostly cobbles. Mineralogy is smectitic. Surface-initiated, reversible cracks 1 to 2 inches (2.5 to 5 cm) wide extend to a depth of 10 to 24 inches (25 to 61 cm) from about May to November for 150 to 180 days when the soils are not irrigated. A fluctuating water table can occur between the top of the bedrock and the surface of the soil from November through May. Rock fragments on the surface range from 0 to 10 percent gravel, 5 to 30 percent cobbles, 0 to 20 stones, and 0 to 3 percent boulders.

The A horizon has dry color of 7.5YR 4/1 or 3/2 or 10YR 4/1 or 3/2. Moist color is 7.5YR 4/2 or 3/2 or 10YR 4/2 or 3/2. Texture is clay, gravelly clay, cobbly clay, or very cobbly clay. The content of clay ranges from 50 to 60 percent. The horizon has 0 to 10 percent gravel, 5 to 35 percent cobbles, and 0 to 5 percent stones. Redoximorphic features occur as iron and iron-manganese masses. Reaction is slightly acid or neutral.

The Bss horizon has dry color of 7.5YR 4/1 or 3/1 or 10YR 4/1. Moist color is 7.5YR 3/2, 4/2, or 4/3 or 10YR 3/2 or 4/2. Texture is clay, gravelly clay, cobbly clay, very cobbly clay, or extremely cobbly clay. The content of clay ranges from 40 to 60 percent. The horizon has 2 to 15 percent gravel, 5 to 60 percent cobbles, and 0 to 10 percent stones. Redoximorphic features occur as iron-manganese nodules and a manganese capping on the bedrock. Reaction is neutral.

The Carhart taxadjunct is a taxadjunct because it is underlain by lithic bedrock instead of paralithic bedrock and is shallow or moderately deep. These differences do not significantly affect the use, management, or interpretations of the soils.

Cerpone Series

The Cerpone series consists of deep, well drained soils that formed in residuum and colluvium derived from serpentinized rocks. These soils are on ridgetops and side slopes on ultramafic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 60 inches (1,524 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, parasesquic, mesic Ultic Haploxeralfs

Typical Pedon

Cerpone gravelly loam, on a northeast-facing slope of 11 percent, under a cover of ponderosa pine, incense cedar, Douglas-fir, and whiteleaf manzanita, at an elevation

of 3,140 feet (957 m). When described on 9/25/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); needles and twigs.
Oe—1 to 2 inches (3 to 4 cm); partially decomposed needles and twigs.
A—2 to 4 inches (4 to 9 cm); light brown (7.5YR 6/4) gravelly loam, dark brown (7.5YR 3/4) moist; 18 percent clay; strong fine and medium granular structure; slightly hard, friable, nonsticky, slightly plastic; many very fine and fine roots throughout; many very fine to medium irregular and tubular pores; noneffervescent; 20 percent gravel; moderately acid, pH 5.9 by pH meter 1:1 water; clear smooth boundary.
Bt1—4 to 9 inches (9 to 24 cm); reddish brown (5YR 5/4) gravelly loam, dark reddish brown (5YR 3/4) moist; 22 percent clay; moderate fine and medium subangular blocky structure; soft, friable, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; many very fine to medium irregular and tubular pores; few faint discontinuous clay films in root channels and pores; noneffervescent; 20 percent gravel and 10 percent cobbles; moderately acid, pH 6.0 by pH meter 1:1 water; clear smooth boundary.
Bt2—9 to 17 inches (24 to 42 cm); yellowish red (5YR 5/6) cobbly loam, dark reddish brown (5YR 3/4) moist; 26 percent clay; moderate fine and medium subangular blocky structure; soft, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine and fine and few medium irregular and tubular pores; few faint discontinuous clay films in root channels and pores; noneffervescent; 10 percent gravel and 20 percent cobbles; slightly acid, pH 6.2 by pH meter 1:1 water; gradual smooth boundary.
Bt3—17 to 26 inches (42 to 67 cm); strong brown (7.5YR 5/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 31 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium irregular and tubular pores; common distinct discontinuous clay films in root channels and pores; noneffervescent; 15 percent gravel; slightly acid, pH 6.3 by pH meter 1:1 water; clear smooth boundary.
Bt4—26 to 41 inches (67 to 103 cm); strong brown (7.5YR 5/6) very gravelly silty clay loam, strong brown (7.5YR 5/8) moist; 34 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium irregular and tubular pores; common distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 40 percent gravel; neutral, pH 6.6 by pH meter 1:1 water; clear smooth boundary.
Bt5—41 to 57 inches (103 to 144 cm); yellowish brown (10YR 5/6) very gravelly silty clay loam, dark yellowish brown (10YR 4/6) moist; 29 percent clay; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine to medium roots; many very fine and fine irregular and tubular pores; few distinct discontinuous clay films in root channels and pores; noneffervescent; 55 percent gravel; neutral, pH 6.7 by pH meter 1:1 water; abrupt smooth boundary.
R—57 inches (144 cm); very strongly cemented ultramafic bedrock.

Type location: Butte County, California; about 1.2 miles northeast of Sawmill Peak, approximately 2,150 feet south and 250 feet east of the northwest corner of sec. 28, T. 23 N., R. 4 E.; 39 degrees, 49 minutes, 23.54 seconds north latitude and 121 degrees, 32 minutes, 29.94 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (51 to 102 cm). The mean annual soil temperature is 55 to 58 degrees F (13 to 14 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 25 to 35 percent clay and 15 to 35 percent rock fragments, mostly gravel. Mineralogy is parasesquic. Rock fragments on the surface range from 10 to 30 percent gravel, 0 to 20 percent cobbles, and 0 to 10 percent stones. The subsurface horizons have more than 40 percent silt. Magnesium extractable bases in the majority of the control section equal or exceed calcium extractable bases.

The A horizon has dry color of 7.5YR 6/3, 6/4, or 6/6 or 5YR 5/4, 6/4, or 6/6. Moist color is 7.5YR 3/4 or 4/3 or 5YR 4/3 or 6/4. Texture is gravelly or very gravelly loam. The content of clay ranges from 16 to 22 percent. The horizon has 15 to 35 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 6/4, 6/6, or 5/8 or 5YR 5/4 or 5/6. Moist color is 7.5YR 4/4 or 5YR 3/4 or 4/4. Texture is gravelly or cobbly loam. The content of clay ranges from 20 to 27 percent. The content of gravel is 10 to 30 percent, and the content of cobbles is 0 to 20 percent. Reaction is moderately acid or slightly acid.

The lower part of the Bt horizon has dry color of 7.5YR 5/6, 6/4, 6/6, or 7/6; 5YR 6/4, 5/6, or 6/6; or 10YR 5/6. Moist color is 7.5YR 5/8; 5YR 4/4, 4/6, or 5/6; or 10YR 4/6. Texture is gravelly clay loam, very gravelly silty clay loam, very gravelly loam, or very gravelly clay loam. The content of clay ranges from 25 to 35 percent. The content of gravel is 15 to 60 percent, the content of cobbles is 0 to 15 percent, and the content of stones is 0 to 5 percent. Reaction is slightly acid or neutral.

Charger Series

The Charger series consists of very deep, moderately well drained soils that formed in overbank alluvium over channel alluvium derived from dominantly volcanic rocks. These soils are on proximal alluvial fans. Slopes range from 0 to 2 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Coarse-loamy, mixed, superactive, thermic Typic Haploxerolls

Typical Pedon

Charger fine sandy loam, on a west-facing slope of less than 1 percent, under a cover of plantain, mouse barley, and valley oak seedlings, at an elevation of 227 feet (69 m). When described on 6/11/1997, the soil was dry from 0 to 42 inches (0 to 107 cm), slightly moist from 42 to 63 inches (107 to 160 cm), and moist below 63 inches (160 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 3 inches (0 to 8 cm); brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; 14 percent clay; moderate medium platy structure parting to moderate fine and medium granular; slightly hard, friable, nonsticky, nonplastic; many very fine and common fine roots; many very fine and fine vesicular and tubular pores; 10 percent gravel; noneffervescent; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

A1—3 to 7 inches (8 to 18 cm); brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; 15 percent clay; weak medium subangular blocky structure; extremely hard, slightly rigid, nonsticky, nonplastic; common very fine and fine roots; common very fine and fine tubular pores; 7 percent gravel; noneffervescent; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

A2—7 to 15 inches (18 to 38 cm); brown (10YR 5/3) fine sandy loam, dark brown (10YR 3/3) moist; 16 percent clay; weak medium subangular blocky structure; hard, very firm, nonsticky, nonplastic; common very fine and fine roots; many very fine and fine and few medium and coarse tubular pores; 2 percent gravel; noneffervescent; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bw1—15 to 32 inches (38 to 81 cm); light yellowish brown (10YR 6/4) sandy loam, dark brown (10YR 3/3) moist; 16 percent clay; weak medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common very fine and fine roots; common very fine and fine and few medium and coarse tubular pores; 2 percent gravel; noneffervescent; slightly alkaline, pH 7.8 by Hellige-Truog; gradual smooth boundary.

Bw2—32 to 42 inches (81 to 107 cm); light yellowish brown (10YR 6/4) sandy loam, brown (10YR 4/3) moist; 13 percent clay; weak medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common very fine and fine roots; many very fine and fine and common medium and coarse tubular pores; 3 percent gravel; noneffervescent; moderately alkaline, pH 8.0 by Hellige-Truog; gradual smooth boundary.

Bw3—42 to 53 inches (107 to 135 cm); very pale brown (10YR 7/4) sandy loam, brown (10YR 4/3) moist; 13 percent clay; weak medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine roots; many very fine and fine and few medium tubular pores; 3 percent gravel; noneffervescent; moderately alkaline, pH 8.0 by Hellige-Truog; gradual smooth boundary.

Bw4—53 to 63 inches (135 to 160 cm); light yellowish brown (10YR 6/4) sandy loam, brown (10YR 4/3) moist; 12 percent clay; weak medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; few very fine and fine roots; many very fine and fine and few medium tubular pores; common fine and medium irregular dark brown (7.5YR 3/4 moist) oxidized iron masses throughout and few fine irregular black (N 2/0 moist) iron-manganese masses between peds; 2 percent gravel; noneffervescent; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

C—63 to 80 inches (160 to 203 cm); very pale brown (10YR 7/3) extremely gravelly loamy coarse sand, brown (10YR 4/3) moist; 3 percent clay; single grain; loose, nonsticky, nonplastic; common very fine roots; many very fine to medium interstitial and tubular pores; 50 percent gravel and 15 percent cobbles; noneffervescent; moderately alkaline, pH 8.0 by Hellige-Truog.

Type location: Butte County, California; about 0.5 mile northwest of the Durham Mutual Diversion Dam, approximately 1,650 feet south and 1,450 feet east of the northwest corner of sec. 5, T. 21 N., R. 2 E.; 39 degrees, 42 minutes, 26.5 seconds north latitude and 121 degrees, 46 minutes, 51.8 seconds west longitude; NAD83; USGS Quad: Chico, California.

Range in Characteristics

Depth to the substratum is 40 to 80 inches (102 to 203 cm). The mean annual soil temperature is 61 to 62 degrees F (16 to 17 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 180 days). The particle-size control section averages 5 to 17 percent clay and 0 to 25 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur at a depth of 40 to 80 inches (102 to 203 cm) from December through April. Redoximorphic features, such as oxidized iron masses and iron-manganese masses with color of 7.5YR 3/4 and N 2/0 moist, occur in the lower part of the Bw horizon. Rock fragments on the surface range from 0 to 15 percent gravel. In some pedons the C horizon has silica pendants under rock fragments.

The Ap horizon has dry color of 10YR 5/3 or 5/4. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2 or 3/3. Texture is fine sandy loam. The content of clay ranges from 8 to 17 percent. The content of gravel is 0 to 15 percent. Reaction ranges from moderately acid to neutral.

The A horizon has dry color of 10YR 5/3 or 5/4. Moist color is 10YR 3/3 or 7.5YR 3/2. Texture is fine sandy loam or sandy loam. The content of clay ranges from 8 to 17 percent. The content of gravel is 0 to 15 percent. Reaction ranges from slightly acid to moderately alkaline.

The Bw horizon has dry color of 10YR 5/3, 6/4, or 7/4 or 7.5YR 5/4 or 6/4. Moist color is 10YR 3/3 or 4/3 or 7.5YR 3/3, 4/2, or 4/3. Texture is fine sandy loam, sandy loam, gravelly sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 8 to 17 percent. The horizon has 0 to 35 percent gravel and 0 to 5 percent cobbles. Reaction ranges from neutral to moderately alkaline.

The C horizon has dry color of 10YR 5/4, 6/3, or 7/3 or 7.5YR 5/4 or 6/3. Moist color is 10YR 3/3 or 4/3 or 7.5YR 4/3. Texture is gravelly sandy loam, very gravelly sandy loam, very gravelly coarse sandy loam, very gravelly coarse sand, extremely gravelly loamy coarse sand, extremely gravelly fine sand, or extremely cobbly sandy loam. The content of clay ranges from 1 to 10 percent. The horizon has 20 to 70 percent gravel, 5 to 35 percent cobbles, and 0 to 15 percent stones. Reaction ranges from neutral to moderately alkaline.

Chawanakee Series

The Chawanakee series consists of shallow, somewhat excessively drained soils that formed in residuum and colluvium derived from intrusive igneous rocks, mainly trondhjemite and quartz diorite. These soils are on ridgetops and side slopes on granitic Sierra Nevada mountains. Slopes range from 2 to 110 percent. The mean annual precipitation is about 72 inches (1,829 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Loamy, mixed, active, mesic shallow Typic Dystroxerepts

Typical Pedon

Chawanakee gravelly sandy loam, on an east-southeast-facing slope of 45 percent, under a cover of greenleaf manzanita, tanoak, ponderosa pine, canyon live oak, and sugar pine, at an elevation of 4,080 feet (1,244 m). When described on 7/5/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

Oe—1 to 2 inches (3 to 5 cm); moderately decomposed plant material; clear smooth boundary.

A—2 to 5 inches (5 to 13 cm); white (2.5Y 8/1) gravelly sandy loam, grayish brown (2.5Y 5/2) moist; 4 percent clay; single grain; loose, nonsticky, nonplastic; many very fine and fine roots; many very fine and fine and common medium interstitial and tubular pores; 20 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; clear smooth boundary.

Bw1—5 to 11 inches (13 to 28 cm); very pale brown (10YR 8/3) gravelly sandy loam, pale brown (10YR 6/3) moist; 5 percent clay; weak fine and medium subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine and common medium irregular and tubular pores; 20 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

Bw2—11 to 19 inches (28 to 48 cm); very pale brown (10YR 8/2) gravelly sandy loam, pale brown (10YR 6/3) moist; 4 percent clay; weak fine and medium

subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; common very fine to coarse roots; many very fine and fine and common medium irregular and tubular pores; 30 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

Cr—19 inches (48 cm); extremely weakly cemented quartz diorite bedrock; strongly acid, pH 5.5 by Hellige-Truog.

Type location: Butte County, California; about 1.25 miles northeast of Ragdump, approximately 1,800 feet south and 2,100 feet west of the northeast corner of sec. 7, T. 23 N., R. 5 E.; 39 degrees, 51 minutes, 58 seconds north latitude and 121 degrees, 27 minutes, 22 seconds west longitude; NAD83; USGS Quad: Pulga, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 47 to 59 degrees F (8 to 15 degrees C). The soil moisture control section is dry in all parts from about mid-June to mid-October (about 120 days). The particle-size control section averages 2 to 6 percent clay and 10 to 35 percent gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 5 percent boulders.

The A horizon has dry color of 10YR 5/1, 5/2, 6/1, 6/2, 6/3, or 7/1 or 2.5Y 8/1. Moist color is 10YR 3/2, 4/1, 4/2, 4/3, or 5/2 or 2.5Y 8/1. Texture is sandy loam, gravelly sandy loam, gravelly coarse sandy loam, or gravelly loamy coarse sand. The content of clay ranges from 2 to 6 percent. The content of gravel is 10 to 30 percent. Reaction is slightly acid or moderately acid.

The Bw horizon has dry color of 10YR 6/3, 7/2, 7/3, 8/2, or 8/3. Moist color is 10YR 4/2, 4/3, 5/3, or 6/3. Texture is gravelly sandy loam, very gravelly sandy loam, gravelly coarse sandy loam, loamy sand, gravelly loamy sand, gravelly loamy coarse sand, or sandy loam. The content of clay ranges from 2 to 6 percent. The content of gravel is 10 to 35 percent. Reaction ranges from slightly acid to strongly acid.

Cherokeespring Series

The Cherokeespring series consists of very deep, well drained soils that formed in alluvium derived from basalt. These soils are on benches on side slopes on basalt plateaus on Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Ultic Palexeralfs

Typical Pedon

Cherokeespring gravelly silt loam, on a north-facing slope of 12 percent, under a cover of hardwoods, shrubs, and annual grasses, at an elevation of 645 feet (196 m). When described on 6/28/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (7.5YR 4/3) gravelly silt loam, dark brown (7.5YR 3/3) moist; 18 percent clay; moderate fine and medium granular structure; slightly hard, friable, slightly sticky, nonplastic; many fine and medium roots; many fine irregular pores; 15 percent basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—3 to 7 inches (8 to 18 cm); brown (7.5YR 4/4) gravelly silt loam, dark brown (7.5YR 3/4) moist; 24 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; many fine and medium roots; many fine irregular pores; 40 percent discontinuous prominent clay

films on faces of peds; 15 percent basalt gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt smooth boundary.

Bt2—7 to 16 inches (18 to 41 cm); brown (7.5YR 4/4) gravelly silty clay loam, dark brown (7.5YR 3/4) moist; 28 percent clay; moderate coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common fine and medium roots; common fine and medium tubular pores; 50 percent continuous prominent clay films on faces of peds; 20 percent basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt3—16 to 30 inches (41 to 76 cm); reddish brown (5YR 4/4) gravelly silty clay loam, dark reddish brown (5YR 3/4) moist; 32 percent clay; moderate coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common very fine and fine roots; common fine tubular pores; 60 percent continuous prominent clay films on faces of peds; 25 percent basalt gravel; moderately acid, pH 5.8 by Hellige-Truog; clear smooth boundary.

Bt4—30 to 42 inches (76 to 107 cm); reddish brown (5YR 4/3) gravelly silty clay loam, dark reddish brown (5YR 3/4) moist; 35 percent clay; moderate coarse prismatic structure; very hard, firm, very sticky, moderately plastic; common very fine and fine roots; common fine tubular pores; 65 percent continuous prominent clay films on faces of peds; 30 percent basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt5—42 to 60 inches (107 to 152 cm); reddish brown (5YR 4/3) very gravelly silty clay, dark reddish brown (5YR 3/4) moist; 40 percent clay; moderate coarse prismatic structure parting to moderate medium angular blocky; hard, firm, very sticky, very plastic; few very fine, fine, and coarse roots between peds; few fine tubular pores; 90 percent continuous prominent clay films on faces of peds; 35 percent basalt gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt6—60 to 68 inches (152 to 173 cm); reddish brown (5YR 4/3) very gravelly silty clay, dark reddish brown (5YR 3/4) moist; 42 percent clay; moderate coarse prismatic structure parting to moderate medium angular blocky; hard, firm, very sticky, very plastic; few very fine roots between peds; few very fine tubular pores; 80 percent continuous prominent clay films on faces of peds; 15 percent basalt cobbles and 30 percent basalt gravel; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 5.9 miles northwest of Oroville, approximately 300 feet east and 500 feet south of the northwest corner of sec. 13, T. 20 N., R. 3 E.; 39 degrees, 35 minutes, 45 seconds north latitude and 121 degrees, 35 minutes, 43 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 27 to 35 percent clay, less than 15 percent sand, more than 50 percent silt, and 15 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 3/4 or 4/3 or 10YR 3/4 or 4/4. Moist color is 7.5YR 2/2, 3/2, 3/3, or 3/4 or 10YR 2/2 or 3/3. Texture is gravelly silt loam or silt loam. The content of clay ranges from 15 to 20 percent. The horizon has 5 to 15 percent gravel and 0 to 5 percent cobbles. Reaction is slightly acid.

The upper part of the Bt horizon has dry color of 5YR 4/4; 7.5YR 3/4, 4/3, or 4/4; or 10YR 3/4. Moist color is 5YR 3/4; 7.5YR 3/2, 3/3, or 3/4; or 10YR 3/2. Texture is gravelly silt loam, silt loam, gravelly silty clay loam, silty clay loam, or cobbly silt loam. The content of clay ranges from 20 to 30 percent. The content of gravel is 10 to 25 percent, and the content of cobbles is 0 to 30 percent. Reaction ranges from moderately acid to neutral.

The middle part of the Bt horizon has dry color of 5YR 4/4, 7.5YR 3/4 or 4/4, or 10YR 3/4. Moist color is 5YR 3/3, 7.5YR 3/3 or 3/4, or 10YR 3/3. Texture is gravelly silty clay loam, very gravelly silty clay loam, very cobbly silt clay loam, or silty clay loam. The content of clay ranges from 28 to 35 percent. The content of gravel is 10 to 30 percent, and the content of cobbles is 0 to 30 percent. Reaction ranges from slightly acid to strongly acid.

The lower part of the Bt horizon has dry color of 5YR 4/3 or 4/4 or 7.5YR 4/4. Moist color is 5YR 3/4 or 7.5YR 3/4. Texture is very gravelly silty clay, very gravelly silty clay loam, very cobbly silty clay loam, or cobbly silty clay loam. The content of clay ranges from 35 to 42 percent. The content of gravel is 10 to 40 percent, and the content of cobbles is 0 to 40 percent. Reaction ranges from strongly acid to neutral.

Cherotable Series

The Cherotable series consists of deep, moderately well drained soils that formed in alluvium and residuum weathered from basalt. These soils are on the top of basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 59 degrees F (15 degrees C).

Taxonomic class: Fine-loamy, parasesquic, thermic Ultic Haploxeralfs

Typical Pedon

Cherotable loam, on a south-facing slope of 5 percent, under a cover of annual grasses, at an elevation of 1,350 feet (411 m). When described on 10/19/2000, the soil was moist from 0 to 21 inches (0 to 53 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/3) loam, brown (7.5YR 4/3) moist; 21 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, nonplastic; many fine and medium roots; many fine and medium irregular pores; 5 percent basalt gravel; very strongly acid, pH 4.8 by pH meter 1:1 water; clear smooth boundary.

Bt1—2 to 8 inches (5 to 20 cm); brown (7.5YR 5/3) loam, brown (7.5YR 4/3) moist; 26 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many fine and medium roots; many fine and medium irregular pores; 15 percent discontinuous faint clay films on surfaces along pores; 10 percent basalt gravel; strongly acid, pH 5.5 by pH meter 1:1 water; clear smooth boundary.

Bt2—8 to 14 inches (20 to 36 cm); brown (7.5YR 5/3) clay loam, brown (7.5YR 4/3) moist; 30 percent clay; moderate coarse subangular blocky structure parting to moderate medium subangular blocky; slightly hard, friable, moderately sticky, slightly plastic; common fine and few very fine roots; common fine tubular and common medium irregular pores; 20 percent discontinuous distinct clay films on surfaces along pores; 10 percent basalt gravel; strongly acid, pH 5.4 by pH meter 1:1 water; gradual smooth boundary.

Bt3—14 to 21 inches (36 to 53 cm); brown (7.5YR 5/3) gravelly clay loam, brown (7.5YR 4/3) moist; 30 percent clay; moderate medium subangular blocky structure parting to moderate coarse subangular blocky; slightly hard, friable, moderately sticky, moderately plastic; few fine and common medium roots; common fine tubular pores; 40 percent discontinuous distinct clay films on faces of peds; 5 percent basalt cobbles and 10 percent basalt gravel; strongly acid, pH 5.5 by pH meter 1:1 water; gradual smooth boundary.

Bt4—21 to 30 inches (53 to 76 cm); brown (7.5YR 5/3) cobbly clay loam, brown (7.5YR 4/3) moist; 31 percent clay; moderate coarse subangular blocky structure

parting to moderate medium subangular blocky; hard, friable, moderately sticky, moderately plastic; few fine roots; few fine tubular pores; 40 percent discontinuous distinct clay films on faces of peds; 10 percent basalt gravel and 10 percent basalt cobbles; strongly acid, pH 5.5 by pH meter 1:1 water; gradual wavy boundary.

Bt5—30 to 45 inches (76 to 114 cm); brown (7.5YR 5/3) very cobbly clay, brown (7.5YR 4/3) moist; 48 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine tubular pores; 45 percent discontinuous distinct clay films on faces of peds; 20 percent basalt gravel and 30 percent basalt cobbles; moderately acid, pH 5.7 by pH meter 1:1 water; abrupt wavy boundary.

R—45 inches (114 cm); indurated basalt bedrock.

Type location: Butte County, California; about 5 miles north of Oroville, approximately 660 feet west and 140 feet north of the southeast corner of sec. 8, T. 20 N., R. 4 E.; 39 degrees, 35 minutes, 54.7 seconds north latitude and 121 degrees, 32 minutes, 29.4 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about May to the end of October (about 150 to 200 days). The particle-size control section averages 27 to 35 percent clay and 10 to 25 percent rock fragments, mostly gravel. Mineralogy is parasesquic. The content of organic matter is 2 to 11 percent to a depth of 2 inches (5 cm) and 1 to 3 percent from a depth of 2 to 45 inches (5 to 114 cm). By ammonium acetate, base saturation ranges from 59 to 73 percent to a depth of 8 inches (20 cm) and is more than 50 percent from a depth of 8 to 45 inches (20 to 114 cm). By sum of cations, base saturation is 38 to 47 percent to a depth of 8 inches (20 cm) and 34 to 36 percent from a depth of 8 to 45 inches (114 cm). A fluctuating water table can occur between the top of the bedrock and 20 inches (51 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 0 to 15 percent gravel. Some pedons have a BCt horizon.

The A horizon has dry color of 7.5YR 3/3 or 4/4 or 10YR 3/4, 4/3, 5/2, or 5/3. Moist color is 7.5YR 2/2, 3/2, 3/3, 4/2, or 4/3 or 10YR 2/2 or 3/2. Texture is loam or gravelly loam. The content of clay ranges from 18 to 24 percent. The horizon has 0 to 20 percent gravel and 0 to 10 percent cobbles. Reaction ranges from very strongly acid to slightly acid.

The Bt1, Bt2, Bt3, and Bt4 horizons have dry color of 5YR 3/4 or 4/4; 7.5YR 3/4, 4/3, 4/4, 5/3, or 5/4; or 10YR 3/4 or 4/4. Moist color is 5YR 3/2, 3/3, or 3/4; 7.5YR 3/2, 3/3, or 4/3; or 10YR 3/2 or 3/3. Texture is loam, gravelly loam, cobbly loam, clay loam, gravelly clay loam, or cobbly clay loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 0 to 20 percent, and the content of cobbles is 0 to 30 percent. Reaction ranges from strongly acid to slightly acid.

The Bt5 horizon has dry color of 5YR 4/3, 4/4, or 5/4; 7.5YR 3/4, 4/3, 4/4, 5/3, or 5/4; or 10YR 3/4, 4/4, 5/4, or 3/6. Moist color is 5YR 3/3, 3/4, or 4/4; 7.5YR 3/3, 3/4, or 4/3; or 10YR 3/3, 3/4, 4/4, or 5/4. Texture is clay loam, gravelly clay loam, cobbly clay loam, very gravelly clay loam, very cobbly clay loam, cobbly clay, or very cobbly clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 10 to 30 percent, and the content of cobbles is 5 to 40 percent. Reaction is strongly acid or moderately acid.

Chico Series

The Chico series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on low fan terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Pachic Argixerolls

Typical Pedon

Chico loam, on a slope of less than 1 percent, under a cover of wheat stubble, at an elevation of 186 feet (57 m). When described on 6/22/1994, the soil was moist below a depth of 5 inches (13 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; 23 percent clay; moderate medium and coarse subangular blocky structure parting to moderate very fine and fine granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and common fine roots; few very fine to medium tubular and common fine and medium irregular pores; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bt1—5 to 10 inches (13 to 25 cm); brown (10YR 4/3) clay loam, dark brown (7.5YR 3/2) moist; 29 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine and fine roots; few very fine to medium tubular and few fine and medium irregular pores; few discontinuous distinct clay films on faces of peds and in pores; slightly alkaline, pH 7.5 by Hellige-Truog; gradual smooth boundary.

Bt2—10 to 21 inches (25 to 53 cm); brown (10YR 4/3) clay loam, dark brown (7.5YR 3/2) moist; 29 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine and few fine roots; many very fine to medium tubular pores; common discontinuous distinct clay films on faces of peds and in pores; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt3—21 to 32 inches (53 to 81 cm); brown (10YR 4/3) clay loam, dark brown (7.5YR 3/2) moist; 29 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine and fine tubular pores; common discontinuous distinct clay films on faces of peds and in pores; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt4—32 to 50 inches (81 to 127 cm); brown (10YR 4/3) loam, dark brown (7.5YR 3/2) moist; 27 percent clay; moderate fine to coarse subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; common very fine roots; many very fine to medium tubular pores; common discontinuous distinct clay films on faces of peds and in pores; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt5—50 to 70 inches (127 to 178 cm); brown (7.5YR 5/3) loam, brown (7.5YR 4/3) moist; 25 percent clay; moderate fine to coarse subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; common very fine roots; many very fine to medium tubular pores; common discontinuous distinct clay films on faces of peds and in pores; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt6—70 to 80 inches (178 to 203 cm); brown (7.5YR 5/4) loam, brown (7.5YR 5/4) moist; 21 percent clay; weak fine and medium subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; common very fine roots; common very fine to medium tubular pores; common fine irregularly shaped reddish brown (5YR 4/4 moist) oxidized iron masses and few fine black (N 2/0 moist) soft iron-

manganese masses throughout; common discontinuous distinct clay films on faces of peds and in pores; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 1 mile south of Chico, approximately 1,500 feet north and 250 feet west of the southeast corner of sec. 2, T. 21 N., R. 1 E.; 39 degrees, 42 minutes, 2 seconds north latitude and 121 degrees, 49 minutes, 27 seconds west longitude; NAD27; USGS Quad: Chico, California.

Range in Characteristics

The thickness of the solum is more than 80 inches (203 cm). Depth to the argillic horizon is 4 to 24 inches (10 to 61 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from May to October (140 to 160 days). The particle-size control section averages 25 to 35 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 5 percent from 0 to 21 inches (0 to 53 cm) and is less than 1 percent from 21 to 80 inches (53 to 203 cm). By ammonium acetate, base saturation ranges from 95 to 100 percent throughout the profile. Some pedons have carbonates below a depth of 35 inches (89 cm).

The Ap horizon has dry color of 10YR 4/2, 4/3, 5/2, or 5/3 or 7.5YR 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2. The content of clay ranges from 20 to 27 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the Bt horizon has dry color of 10YR 4/3, 5/3, or 5/4 or 7.5YR 4/3, 5/2, 5/3, or 5/4. Moist color is 10YR 3/2, 3/3, or 4/3 or 7.5YR 3/2, 3/3, or 3/4. Texture is loam, clay loam, or silty clay loam. The content of clay ranges from 25 to 35 percent. Reaction ranges from slightly acid to slightly alkaline.

The lower part of the Bt horizon has dry color of 10YR 4/3, 5/3, or 5/4 or 7.5YR 4/2, 4/3, 5/3, 4/4, or 5/4. Moist color is 10YR 4/3 or 5/4 or 7.5YR 3/2, 3/3, 3/4, 4/3, or 4/4. Texture is loam or clay loam. The content of clay ranges from 18 to 35 percent. Oxidized iron masses and iron-manganese masses occur below a depth of 70 inches (178 cm). Reaction is neutral or slightly alkaline.

Chinacamp Series

The Chinacamp series consists of very deep, well drained soils that formed in colluvium derived from volcanic mudflow breccia. These soils are on side slopes in canyons on Cascade foothills. Slopes range from 3 to 70 percent. The mean annual precipitation is about 38 inches (965 mm), and the mean annual air temperature is about 59 degrees F (15 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Haplic Palexeralfs

Typical Pedon

Chinacamp gravelly loam, on an east-southeast-facing slope of 55 percent, under a cover of canyon live oak, California laurel, deerbrush, and Pacific poison oak, at an elevation of 490 feet (149 m). When described on 6/30/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 5 inches (3 to 13 cm); pale brown (10YR 6/3) gravelly loam, dark grayish brown (10YR 4/2) moist; 26 percent clay; moderate fine and medium subangular blocky structure parting to strong fine granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine to coarse tubular pores; 5 percent cobbles and 25 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt1—5 to 15 inches (13 to 38 cm); pale brown (10YR 6/3) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 30 percent clay; moderate fine and medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 70 percent continuous faint clay films; 5 percent stones, 5 percent cobbles, and 20 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt2—15 to 29 inches (38 to 74 cm); pale brown (10YR 6/3) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 34 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 5 percent boulders, 5 percent stones, 5 percent cobbles, and 20 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt3—29 to 38 inches (74 to 97 cm); brown (10YR 5/3) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 37 percent clay; strong fine and medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common very fine and fine and few medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 5 percent stones, 5 percent cobbles, 10 percent boulders, and 15 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt4—38 to 44 inches (97 to 112 cm); brown (10YR 5/3) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 36 percent clay; strong fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 5 percent boulders, 5 percent stones, 5 percent cobbles, and 10 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt5—44 to 61 inches (112 to 155 cm); pale brown (10YR 6/3) extremely stony clay loam, brown (10YR 4/3) moist; 37 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 10 percent cobbles, 10 percent gravel, and 50 percent stones; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt6—61 to 72 inches (155 to 183 cm); light yellowish brown (10YR 6/4) very stony clay loam, brown (10YR 4/3) moist; 35 percent clay; moderate fine and medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine and fine roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 5 percent gravel, 10 percent cobbles, and 30 percent stones; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 2.7 miles south-southwest of Centerville, approximately 450 feet east and 1,800 feet south of the northwest corner of sec. 20, T. 22 N., R. 3 E.; 39 degrees, 45 minutes, 4 seconds north latitude and 121 degrees, 40 minutes, 20 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The particle-size control section averages 27 to 35 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 20 percent cobbles, 0 to 30 percent stones, and 0 to 15 percent boulders.

The A horizon has dry color of 10YR 6/3 or 7/3 or 7.5YR 6/4 or 7/2. Moist color is 10YR 4/2 or 7.5YR 4/3. Texture is gravelly loam, extremely cobbly loam, very gravelly

sandy clay loam, or very cobbly sandy clay loam. The content of clay ranges from 20 to 26 percent. The horizon has 5 to 30 percent gravel, 0 to 20 percent cobbles, 0 to 10 percent stones, and 0 to 5 percent boulders. Reaction is neutral or slightly acid.

The Bt horizon has dry color of 10YR 5/3, 5/4, 6/3, 6/4, 7/2, 7/3, or 7/4 or 7.5YR 6/6 or 7/4. Moist color is 10YR 4/2, 4/3, or 4/4 or 7.5YR 4/4 or 5/4. Texture is gravelly clay loam, very gravelly clay loam, extremely cobbly clay loam, very stony clay loam, extremely stony clay loam, extremely gravelly sandy clay loam, gravelly clay, or cobbly clay. The content of clay ranges from 27 to 42 percent. The horizon has 5 to 45 percent gravel, 5 to 45 percent cobbles, 0 to 30 percent stones, and 0 to 10 percent boulders. Reaction ranges from neutral to moderately acid.

Clear Lake Series

The Clear Lake series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Endoaquerts

Typical Pedon

Clear Lake silty clay loam, on a slope of 0 percent, under a cover of dock, cocklebur, tules, arnica ssp., and bermudagrass, at an elevation of 55 feet (17 m). When described on 9/16/1993, the soil was moist throughout. Free water was moving laterally at a depth of 31 inches (79 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 6 inches (0 to 15 cm); gray (10YR 5/1) and grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; 38 percent clay; moderate thin platy structure; slightly hard, firm, slightly sticky, moderately plastic; many very fine and common fine roots; few very fine tubular pores; noneffervescent; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Akb—6 to 12 inches (15 to 31 cm); gray (10YR 5/1) silty clay, very dark gray (10YR 3/1) moist; 50 percent clay; moderate very fine subangular blocky structure; very hard, very firm, very sticky, very plastic; common very fine roots; few very fine tubular pores; common carbonate masses; common fine prominent strong brown (7.5YR 4/6) oxidized iron masses; strongly effervescent; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

Bkssb1—12 to 35 inches (31 to 89 cm); gray (10YR 5/1) silty clay, dark gray (10YR 4/1) moist; 50 percent clay; moderate medium prismatic structure; extremely hard, extremely firm, very sticky, very plastic; common very fine roots; few very fine tubular pores; slickensides; common carbonate masses; common fine prominent strong brown (7.5YR 4/6) oxidized iron masses and few fine prominent black (N 2/0) manganese masses; violently effervescent; moderately alkaline, pH 8.2 by Hellige-Truog; clear smooth boundary.

Bkssb2—35 to 50 inches (89 to 127 cm); light brownish gray (10YR 6/2) silty clay, dark gray (10YR 4/1) moist; 45 percent clay; moderate medium prismatic structure; extremely hard, extremely firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; slickensides; common carbonate masses and common fine prominent black (N 2/0) manganese masses; violently effervescent; moderately alkaline, pH 8.2 by Hellige-Truog; clear smooth boundary.

Bkgb1—50 to 60 inches (127 to 152 cm); light gray (10YR 7/1) silty clay, dark gray (10YR 4/1) moist; 42 percent clay; weak medium prismatic structure; very hard, extremely firm, very sticky, very plastic; few very fine roots; few very fine tubular

pores; strongly effervescent throughout; strongly alkaline, pH 8.5 by Hellige-Truog; gradual smooth boundary.

Bkgb2—60 to 70 inches (152 to 178 cm); light gray (10YR 7/2) silty clay, dark gray (5Y 4/1) moist; 45 percent clay; moderate fine angular blocky structure; very hard, extremely firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; strongly effervescent throughout; strongly alkaline, pH 8.5 by Hellige-Truog; gradual smooth boundary.

Bkgb3—70 to 72 inches (178 to 183 cm); light olive brown (2.5Y 5/3) silty clay, olive gray (5Y 5/2) and gray (5Y 5/1) moist; 50 percent clay; moderate fine angular blocky structure; very hard, extremely firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; strongly effervescent throughout; strongly alkaline, pH 8.5 by Hellige-Truog.

Type location: Butte County, California; about 16.7 miles northwest of Pennington, approximately 200 feet east and 2,300 feet south of the northwest corner of sec. 8, T. 17 N., R. 1 E.; 39 degrees, 20 minutes, 28 seconds north latitude and 121 degrees, 53 minutes, 26 seconds west longitude; NAD27; USGS Quad: Sanborn Slough, California.

Range in Characteristics

The depth of the soils is more than 72 inches (183 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The soil moisture control section is dry from July to October (120 to 125 days). The particle-size control section averages 45 to 55 percent clay. The soils are calcareous from a depth of 6 to 72 inches (15 to 183 cm). Surface-initiated cracks 0.4 inch (1 cm) or more wide extend to a depth of 25 inches (64 cm) or more. They are open from June to October (150 to 180 days) in nonirrigated areas and are closed the rest of the year. Slickensides occur at a depth of 12 to 80 inches (31 to 203 cm). Redoximorphic features occur mainly as oxidized iron masses and manganese masses from 0 to 50 inches (0 to 127 cm) and a reduced matrix below a depth of 50 inches (127 cm). A fluctuating water table can occur between the surface and 80 inches (203 cm) below the surface from December through May and is 40 to 80 inches (102 to 203 cm) below the surface from June through November. Overwash of silty clay loam ranges from 0.5 inch to 20 inches (1 to 51 cm) in thickness. Some pedons do not have an Ak horizon.

The A horizon has dry color of 10YR 3/1, 4/1, 5/1, or 5/2 or 5Y 3/1. Moist color is 10YR 2/1, 2/2, 3/1, 3/2, 4/2; 5Y 3/1 or 2/1; or N 3/0. Texture is silty clay loam. The content of clay ranges from 35 to 40 percent. Reaction ranges from neutral to moderately alkaline.

The Akb horizon has dry color of 10YR 4/1 or 5/1 or 5Y 3/1. Moist color is 10YR 2/1, 3/1, or 4/2. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. Reaction is slightly alkaline or moderately alkaline.

The Bkssb and Bgb horizons have dry color of 10YR 3/1, 4/1, 5/1, or 7/1 or 5Y 5/1. Moist color is 10YR 2/1, 2/2, 3/1, 3/2, or 4/1 or 2.5Y 3/1, 3/2, or 4/2. Texture is clay or silty clay. The content of clay ranges from 40 to 60 percent. Reaction is moderately alkaline or strongly alkaline.

The Bkgb horizon has dry color of 10YR 7/1 or 7/2 or 5Y 5/1 or 5/3. Moist color is 10YR 4/1 or 4/2; 5Y 4/1, 5/1, or 5/2; N 3/0; or 5GY 3/1. Texture is clay, silty clay, silty clay loam, or clay loam. The content of clay ranges from 35 to 60 percent. Reaction is moderately alkaline or strongly alkaline.

Clearhayes Series

The Clearhayes series consists of deep, somewhat poorly drained soils that formed in overbank alluvium over channel alluvium derived from volcanic rocks.

These soils are on bars on low strath terraces on Cascade foothills. Slopes range from 0 to 2 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Haploxeralfs

Typical Pedon

Clearhayes sandy clay loam, on a south-facing slope of 0.5 percent, under a cover of filaree, medusahead, Mediterranean barley, and clover, at an elevation of 198 feet (60 m). When described on 4/5/2000, the soil was dry to a depth of 19 inches (48 cm), very slightly moist between 19 and 28 inches (48 and 71 cm), slightly moist between 28 and 38 inches (71 and 97 cm), and moist below 38 inches (97 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); pale brown (10YR 6/3) sandy clay loam, dark grayish brown (10YR 4/2) moist; 25 percent clay; moderate medium and thick platy structure; extremely hard, friable, slightly sticky, slightly plastic; few fine and common very fine roots; common very fine and fine tubular pores; 5 percent gravel; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 10 inches (5 to 25 cm); grayish brown (10YR 5/2) gravelly sandy clay loam, dark grayish brown (10YR 4/2) moist; 34 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; few fine and common very fine roots; common very fine to medium tubular pores; 80 percent continuous distinct clay films; 18 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt2—10 to 19 inches (25 to 48 cm); grayish brown (10YR 5/2) gravelly sandy clay loam, dark grayish brown (10YR 4/2) moist; 30 percent clay; moderate fine and medium subangular blocky structure; very hard, very friable, moderately sticky, moderately plastic; common very fine roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 5 percent cobbles and 15 percent gravel; slightly alkaline, pH 7.4 by Hellige-Truog; clear smooth boundary.

C1—19 to 28 inches (48 to 71 cm); grayish brown (10YR 5/2) extremely gravelly sandy loam, dark gray (10YR 4/1) moist; 17 percent clay; single grain; slightly hard, very friable, slightly sticky, nonplastic; common very fine roots; many very fine and fine irregular and tubular pores; 25 percent cobbles and 40 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; gradual smooth boundary.

C2—28 to 38 inches (71 to 97 cm); light brownish gray (10YR 6/2) extremely gravelly loamy coarse sand, dark gray (10YR 4/1) moist; 2 percent clay; single grain; loose, nonsticky, nonplastic; few very fine roots; many very fine to medium interstitial pores; 35 percent cobbles and 40 percent gravel; strongly alkaline, pH 8.5 by Hellige-Truog; clear smooth boundary.

C3—38 to 46 inches (97 to 117 cm); very pale brown (10YR 7/4) extremely gravelly sandy clay loam, brown (10YR 5/3) moist; 26 percent clay; single grain; hard, very friable, slightly sticky, slightly plastic; many very fine to medium interstitial pores; 3 percent stones, 35 percent cobbles, and 40 percent gravel; strongly alkaline, pH 8.5 by Hellige-Truog; abrupt smooth boundary.

2Cr—46 inches (117 cm); very weakly cemented volcanic sandstone bedrock; strongly alkaline, pH 8.5.

Type location: Butte County, California; about 0.8 mile east of the Durham-Pentz Road/Highway 99 overpass, approximately 1,200 feet north and 2,400 feet west of the southeast corner of sec. 25, T. 21 N., R. 2 E.; 39 degrees, 38 minutes, 34 seconds north latitude and 121 degrees, 42 minutes, 5 seconds west longitude; NAD83; USGS Quad: Hamlin Canyon, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 68 degrees F (17 to 20 degrees C). The particle-size control section averages 27 to 35 percent clay and 5 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the bedrock and 13 inches (33 cm) below the surface from December through April. Rock fragments on the surface range from 0 to 30 percent gravel, 0 to 5 percent cobbles, and 0 to 2 percent stones. Some pedons do not have a C horizon.

The A horizon has dry color of 10YR 6/2, 6/3, or 6/4 or 7.5YR 5/3, 6/2, or 6/3. Moist color is 10YR 4/2, 4/3, or 5/2 or 7.5YR 4/2. Texture is sandy clay loam, loam, clay loam, gravelly sandy loam, or gravelly loam. The content of clay ranges from 18 to 30 percent. The horizon has 2 to 25 percent gravel and 0 to 5 percent cobbles. Reaction ranges from slightly acid to slightly alkaline

The Bt horizon has dry color of 10YR 5/2, 6/2, or 6/3 or 7.5YR 6/2, 6/3, or 5/3. Moist color is 10YR 4/1, 4/2, 5/2, or 5/3 or 7.5YR 4/2 or 4/3. Texture is sandy clay loam, clay loam, gravelly loam, gravelly clay loam, gravelly sandy clay loam, or very gravelly sandy clay loam. The content of clay ranges from 17 to 35 percent. The horizon has 5 to 35 percent gravel and 0 to 15 percent cobbles. Reaction ranges from neutral to strongly alkaline.

The C horizon has dry color of 10YR 6/2, 7/3, or 7/4 or 7.5YR 6/4. Moist color is 10YR 4/1 or 5/3 or 7.5YR 5/3. Texture is very gravelly coarse sandy loam, extremely gravelly sandy clay loam, extremely gravelly sandy loam, extremely gravelly loamy coarse sand, or very cobbly sandy clay loam. The content of clay ranges from 2 to 30 percent. The horizon has 20 to 60 percent gravel, 5 to 35 percent cobbles, and 0 to 15 percent stones. Reaction ranges from slightly alkaline to strongly alkaline.

Coalcanyon Series

The Coalcanyon series consists of very deep, well drained soils that formed in colluvium derived from basalt. These soils are on side slopes on basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 5 to 50 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, parasesquic, thermic Pachic Ultic Argixerolls

Typical Pedon

Coalcanyon very cobbly loam, on a west-facing slope of 45 percent, under a cover of hardwoods, shrubs, and annual grasses, at an elevation of 950 feet (290 m). When described on 6/26/2001, the soil was dry to a depth of 27 inches (69 cm) and moist below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 4/3) very cobbly loam, dark brown (7.5YR 3/2) moist; 16 percent clay; moderate fine granular structure; slightly hard, friable, slightly sticky, nonplastic; many very fine and fine roots; many fine irregular pores; 10 percent basalt gravel and 30 percent basalt cobbles; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

BAt—2 to 11 inches (5 to 28 cm); brown (7.5YR 4/3) very cobbly loam, dark brown (7.5YR 3/2) moist; 18 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, nonplastic; many fine and medium roots throughout and common coarse roots between peds; many fine irregular pores; 5 percent discontinuous faint clay films on surfaces along pores; 15 percent basalt gravel and 40 percent basalt cobbles; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bt1—11 to 27 inches (28 to 69 cm); brown (7.5YR 4/3) very cobbly loam, dark brown (7.5YR 3/2) moist; 22 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and medium roots throughout and common coarse roots between peds; common fine and medium tubular pores; 20 percent discontinuous faint clay films on surfaces along pores; 20 percent basalt gravel and 30 percent basalt cobbles; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bt2—27 to 43 inches (69 to 109 cm); brown (7.5YR 4/3) very cobbly loam, dark brown (7.5YR 3/3) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, firm, moderately sticky, slightly plastic; common very fine, fine, and coarse roots between peds; common fine and medium tubular pores; 35 percent discontinuous distinct clay films on surfaces along pores; 25 percent basalt gravel and 35 percent basalt cobbles; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

Bt3—43 to 65 inches (109 to 165 cm); reddish brown (5YR 4/3) extremely cobbly clay loam, dark reddish brown (5YR 3/3) moist; 29 percent clay; moderate medium subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; common very fine and fine roots between peds; common fine tubular pores; 50 percent discontinuous distinct clay films on surfaces along pores; 20 percent basalt gravel and 50 percent basalt cobbles; moderately acid, pH 6.0 by Hellige-Truog.

Type location: Butte County, California; about 5.7 miles northwest of Oroville, approximately 1,500 feet east and 1,300 feet south of the northwest corner of sec. 13, T. 20 N., R. 3 E.; 39 degrees, 35 minutes, 35 seconds north latitude and 121 degrees, 35 minutes, 23 seconds west longitude; NAD27; USGS Quad: Oroville, California.

Range in Characteristics

The depth of to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 18 to 27 percent clay and 35 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. The content of organic matter is 1 to 13 percent to a depth of 43 inches (3 to 109 cm) and is less than 1 percent below that depth. By ammonium acetate, base saturation ranges from 78 to 91 percent throughout the profile. By sum of cations, it ranges from 55 to 58 percent. Rock fragments on the surface range from 10 to 60 percent gravel, 5 to 65 percent cobbles, 0 to 25 percent stones, and 0 to 20 percent boulders. Some pedons have silty textures throughout.

The A horizon has dry color of 10YR 3/3, 3/4, 4/2, 4/3, or 4/4 or 7.5YR 4/3. Moist color is 10YR 2/2, 3/2, or 3/3 or 7.5YR 3/2. Texture is very cobbly loam, very gravelly loam, or gravelly loam. The content of clay ranges from 14 to 18 percent. The horizon has 10 to 55 percent gravel, 5 to 35 percent cobbles, 0 to 45 percent stones, and 0 to 15 percent boulders. Reaction is slightly acid or neutral.

The BAt horizon has dry color of 10YR 4/2 or 4/3 or 7.5YR 4/3 or 4/4. Moist color is 10YR 2/2, 3/2, or 3/3 or 7.5YR 3/2 or 3/3. Texture is very cobbly loam or very gravelly loam. The content of clay ranges from 16 to 22 percent. The horizon has 15 to 50 percent gravel, 5 to 40 percent cobbles, 0 to 55 percent stones, and 0 to 15 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 4/3, 4/4, 4/6, 5/3, or 5/4; 7.5YR 4/3; or 5YR 4/3. Moist color is 10YR 3/2, 3/3, 3/4, or 4/4 or 7.5YR 3/2 or 3/3. Texture is very cobbly loam, extremely cobbly loam, very cobbly clay loam, extremely cobbly clay loam, extremely gravelly loam, or extremely gravelly clay loam. The content of clay ranges from 22 to 35 percent. The horizon has 20 to 80 percent gravel, 5 to 50 percent cobbles, 0 to 60 percent stones, and 0 to 15 percent boulders. Reaction ranges from moderately acid to neutral.

Coalcanyon Taxadjunct

The Coalcanyon taxadjunct consists of very deep, well drained soils that formed in colluvium derived from basalt. These soils are on side slopes and benches in canyons on Cascade foothills. Slopes range from 3 to 70 percent. The mean annual precipitation is about 37 inches (940 mm), and the mean annual air temperature is about 59 degrees F (15 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Haplic Palexeralfs

Typical Pedon

Coalcanyon taxadjunct, on a northwest-facing slope of 15 percent, under a cover of blue oak, interior live oak, foothill pine, deerbrush, and annual grasses and forbs, at an elevation of 800 feet (244 meters). When described on 5/31/2000, the soil was dry to a depth of 42 inches (107 cm) and slightly moist from 42 to 72 inches (107 to 183 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light brown (7.5YR 6/4) very gravelly loam, brown (7.5YR 4/2) moist; 23 percent clay; moderate fine and medium granular structure; hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine to medium irregular and tubular pores; 15 percent cobbles and 20 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); light brown (7.5YR 6/4) very gravelly loam, brown (7.5YR 4/3) moist; 26 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous faint clay films on faces of peds; 15 percent cobbles and 20 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Bt2—6 to 14 inches (15 to 36 cm); brown (7.5YR 5/4) very gravelly clay loam, brown (7.5YR 4/3) moist; 28 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common coarse and many very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous faint clay films on faces of peds; 15 percent cobbles and 20 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Bt3—14 to 24 inches (36 to 61 cm); brown (7.5YR 5/4) very gravelly clay loam, brown (7.5YR 4/3) moist; 30 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; many very fine to medium tubular pores; 80 percent continuous faint clay films on faces of peds; 15 percent cobbles and 20 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

Bt4—24 to 42 inches (61 to 107 cm); brown (7.5YR 5/3) extremely cobbly clay loam, brown (7.5YR 4/2) moist; 33 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films on faces of peds; 35 percent gravel and 35 percent cobbles; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

2Bt5—42 to 54 inches (107 to 137 cm); brown (7.5YR 5/4) very cobbly clay, brown (7.5YR 4/3) moist; 42 percent clay; strong fine and medium subangular blocky structure; hard, friable, very sticky, very plastic; common very fine and fine and few medium roots; common very fine and fine tubular pores; 80 percent continuous distinct clay films on faces of peds; 25 percent gravel and 25 percent cobbles; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

2Bt6—54 to 72 inches (137 to 183 cm); brown (7.5YR 5/4) very gravelly clay loam, brown (7.5YR 4/3) moist; 39 percent clay; strong fine and medium subangular blocky structure; hard, friable, very sticky, very plastic; few very fine to coarse

roots; common very fine and fine tubular pores; 80 percent continuous distinct clay films on faces of peds; 20 percent cobbles and 40 percent gravel; neutral, pH 6.8 by Hellige-Truog.

Type location: Butte County, California; about 0.75 mile west-southwest of the intersection of Highway 32 and Ten Mile Road, approximately 800 feet south and 1,250 feet west of the center of sec. 35, T. 23 N., R. 2 E.; 39 degrees, 48 minutes, 15 seconds north latitude and 121 degrees, 43 minutes, 36 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 180 days). The particle-size control section averages 27 to 35 percent clay and 35 to 80 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 10 to 60 percent gravel, 5 to 50 percent cobbles, 0 to 30 percent stones, and 0 to 25 percent boulders.

The A horizon has dry color of 7.5YR 6/2, 6/3, or 6/4 or 10YR 6/2, 6/3, 5/4, or 6/4. Moist color is 7.5YR 3/2 or 4/2 or 10YR 3/2, 4/2, or 4/3. Texture is very gravelly loam, very cobbly loam, or extremely cobbly loam. The content of clay ranges from 20 to 27 percent. The horizon has 20 to 35 percent gravel, 10 to 25 percent cobbles, 0 to 25 percent stones, and 0 to 20 percent boulders. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 7.5YR 4/3, 5/3, 5/4, 6/3, or 6/4 or 10YR 5/3 or 6/4. Moist color is 7.5YR 4/2 or 4/3 or 10YR 4/2 or 4/3. Texture is very gravelly loam, extremely cobbly loam, very stony loam, very gravelly clay loam, very cobbly clay loam, very stony clay loam, extremely gravelly clay loam, extremely cobbly clay loam, or extremely stony clay loam. The content of clay ranges from 23 to 35 percent. The content of gravel is 5 to 40 percent, the content of cobbles is 15 to 35 percent, the content of stones is 0 to 30 percent, and the content of boulders is 0 to 15 percent. Reaction is slightly acid or neutral.

The lower part of the Bt horizon has dry color of 7.5YR 4/3, 5/3, or 5/4 or 10YR 6/3. Moist color is 7.5YR 4/2 or 4/3 or 10YR 4/3. Texture is very gravelly clay loam, very cobbly clay loam, extremely stony clay loam, very cobbly clay, or extremely bouldery clay. The content of clay ranges from 30 to 50 percent. The content of gravel is 5 to 40 percent, the content of cobbles is 10 to 35 percent, the content of stones is 0 to 30 percent, and the content of boulders is 0 to 15 percent. Reaction is slightly acid or neutral.

The Coalcanyon taxadjunct is a taxadjunct because it has lighter colors in the A horizon than is defined as the range for the series. This difference does not significantly affect the use, management, or interpretations of the soils.

Codora Series

The Codora series consists of very deep, somewhat poorly drained soils that formed in alluvium derived from igneous, metamorphic, and sedimentary rocks. These soils are on flood plains. Slopes range from 0 to 2 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Fluventic Haploxerepts

Typical Pedon

Codora silty clay loam, on a slope of 1 percent, under a cover of nonirrigated barley, at an elevation of 85 feet (26 m). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 6 inches (0 to 15 cm); grayish brown (2.5Y 5/2) silty clay loam, very dark grayish brown (2.5Y 3/2) moist; 4 percent sand; 65 percent silt; 31 percent clay; coarse subangular blocky structure parting to medium granular; hard, firm, slightly sticky, moderately plastic; many very fine and fine roots; few very fine tubular and many very fine to medium irregular pores; neutral, pH 6.7; abrupt smooth boundary.

A—6 to 11 inches (15 to 28 cm); grayish brown (2.5Y 5/2) silty clay loam, very dark grayish brown (2.5Y 3/2) moist; 4 percent sand; 64 percent silt; 32 percent clay; moderate coarse subangular blocky structure; hard, firm, slightly sticky, moderately plastic; many very fine and fine roots; few very fine tubular and many very fine to medium irregular pores; neutral, pH 6.7; clear smooth boundary.

Bw1—11 to 22 inches (28 to 56 cm); grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; 3 percent sand; 59 percent silt; 38 percent clay; weak coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; many very fine roots; many very fine and fine tubular and common very fine to medium irregular pores; organic stains and 3 percent patchy clay films; neutral, pH 7.1; clear smooth boundary.

Bw2—22 to 38 inches (56 to 96 cm); 50 percent grayish brown (10YR 5/2) and 50 percent light brownish gray (10YR 6/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; 4 percent sand; 57 percent silt; 39 percent clay; massive; hard, firm, moderately sticky, moderately plastic; few very fine roots; many very fine and fine tubular and common very fine irregular pores; 1 percent patchy clay films; neutral, pH 7.2; clear smooth boundary.

Bw3—38 to 60 inches (96 to 152 cm); pale brown (10YR 6/3) silty clay loam, dark brown (10YR 3/3) moist; 7 percent sand; 61 percent silt; 32 percent clay; moderate coarse subangular blocky structure; hard, firm, slightly sticky, moderately plastic; few very fine roots; many very fine and fine tubular and common very fine to medium irregular pores; finely disseminated carbonates; carbonate masses lining pores; slight effervescence; moderately alkaline, pH 8.1.

Type location: Glenn County, California; about 0.67 mile northeast of Butte City, 1,500 feet west and 2,500 feet south of the northwest corner of sec. 28, T. 19 N., R. 1 W.; 39 degrees, 28 minutes, 20 seconds north latitude and 121 degrees, 58 minutes, 50 seconds west longitude; NAD27; USGS Quad: Butte City, California.

Range in Characteristics

Depth to buried silty clay is 60 to 80 inches (152 to 203 cm) or more. The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 36 to 40 percent clay. Mineralogy is mixed. The soils are intermittently calcareous from a depth of 38 to 60 inches (96 to 152 cm). A fluctuating water table can occur between depths of 38 and 80 inches (96 to 203 cm) or more from December through April. Redoximorphic features, such as oxidized iron masses or manganese masses, may occur in all horizons.

The Ap and A horizons have dry color of 2.5Y 5/2 or 6/2. Moist color is 2.5Y 3/2 or 4/2. Texture is silty clay loam or clay loam. The content of clay ranges from 27 to 40 percent. The content of organic matter is 1 to 3 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the Bw horizon has dry color of 10YR 5/2 or 6/2. Moist color is 10YR 3/2. Texture is silty clay loam, clay loam, or clay. The content of clay ranges from 35 to 40 percent. The content of organic matter is 0.5 to 3 percent. Reaction is neutral or slightly alkaline.

The lower part of the Bw horizon has dry color of 10YR 5/3, 6/3, or 6/4. Moist color is 10YR 3/3 or 4/4. Texture is silty clay loam, silty clay, or clay. The content of clay

ranges from 27 to 45 percent. Calcium carbonate is finely disseminated. The content of organic matter is 0.5 to 1 percent. Reaction is slightly alkaline or moderately alkaline.

Columbia Series

The Columbia series consists of very deep, somewhat poorly drained soils that formed in stratified overbank alluvium derived from igneous, metamorphic, and sedimentary rocks. These soils are in sloughs and active channels within the meander belt portion of the flood plains along the Sacramento and Feather Rivers. Slopes range from 0 to 2 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Coarse-loamy, mixed, superactive, nonacid, thermic Oxyaquic Xerofluvents

Typical Pedon

Columbia stratified sand to fine sandy loam, on a slope of 2 percent, under a cover of California sycamore, willow, and black walnut, at an elevation of 150 feet (46 m). When described on 9/21/1988, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 5 inches (0 to 13 cm); yellowish brown (10YR 5/4), stratified sand to fine sandy loam, dark grayish brown (10YR 4/2) moist; 10 percent clay; single grain and moderate fine granular structure; hard, friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine interstitial pores; neutral, pH 7.3 by Hellige-Truog; abrupt smooth boundary.

C1—5 to 10 inches (13 to 25 cm); pale brown (10YR 6/3), stratified silt loam to sandy loam, brown (10YR 4/3) moist; 10 percent clay; strong thin platy structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; many very fine interstitial pores; 1 percent fine distinct dark yellowish brown (10YR 4/6 moist) oxidized iron masses; neutral, pH 7.3 by Hellige-Truog; abrupt smooth boundary.

C2—10 to 29 inches (25 to 74 cm); yellowish brown (10YR 5/4) loam, brown (10YR 4/3) moist; 10 percent clay; weak fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; few fine and many very fine tubular pores; 4 percent fine distinct dark yellowish brown (10YR 4/6 moist) oxidized iron masses; slightly alkaline, pH 7.6 by Hellige-Truog; clear smooth boundary.

C3—29 to 37 inches (74 to 94 cm); yellowish brown (10YR 5/4) fine sandy loam, dark yellowish brown (10YR 3/4) moist; 9 percent clay; massive; soft, very friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine tubular pores; 1 percent fine distinct dark yellowish brown (10YR 4/6 moist) oxidized iron masses; slightly alkaline, pH 7.6 by Hellige-Truog; abrupt smooth boundary.

C4—37 to 46 inches (94 to 117 cm); yellowish brown (10YR 5/4) sand, brown (10YR 4/3) moist; 5 percent clay; single grain; loose, nonsticky, nonplastic; few very fine and fine roots; many very fine interstitial pores; 1 percent fine distinct dark yellowish brown (10YR 4/6 moist) oxidized iron masses; slightly alkaline, pH 7.6 by Hellige-Truog; abrupt smooth boundary.

C5—46 to 60 inches (117 to 152 cm); light gray (10YR 7/1), stratified fine sandy loam to fine sand, dark grayish brown (10YR 4/2) moist; 8 percent clay; massive; loose, nonsticky, nonplastic; few very fine and fine roots; many very fine tubular pores; 4 percent fine distinct dark yellowish brown (10YR 4/6 moist) oxidized iron masses; slightly alkaline, pH 7.6 by Hellige-Truog.

Type location: Butte County, California; about 3.8 miles southwest of Cana, approximately 5,500 feet west and 2,900 feet north of the corner of T. 22 N. and T. 23 N., R. 1 W. and R. 2 W.; in an unsectionized area in the Bosquejo Land Grant; 39 degrees, 48 minutes, 22 seconds north latitude and 122 degrees, 2 minutes, 55 seconds west longitude; NAD27; USGS Quad: Foster Island, California.

Range in Characteristics

The depth of the soils is more than 60 inches (152 cm), and the depth to gravel ranges from 40 to 60 inches (102 to 152 cm) or more. The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 10 to 18 percent clay. Mineralogy is mixed. Base saturation is assumed to range from 90 to 100 percent throughout the profile. A fluctuating water table can occur at a depth of 20 to 72 inches (51 to 183 cm) from December through April. Flood debris, such as logs, limbs, leaves, and grass, commonly is on the surface.

The A horizon has dry color of 10YR 5/3, 5/4, 6/2, 6/3, or 7/2. Moist color is 10YR 4/2 or 4/3. The horizon has strata of sand, loamy sand, loamy fine sand, fine sandy loam, or loam, and the texture may change seasonally following periods of flooding. The content of clay ranges from 5 to 20 percent. The content of gravel is 0 to 5 percent. The content of organic matter is 1 to 3 percent and decreases irregularly with increasing depth. Reaction is neutral or slightly alkaline.

The C horizon has dry color of 10YR 5/4, 6/3, or 7/1. Moist color is 10YR 3/3, 3/4, 4/2, 4/3, 4/4, or 6/2. The horizon has strata of fine sandy loam, very fine sandy loam, loamy fine sand, loam, silt loam, or gravelly sand. The content of clay ranges from 5 to 18 percent. The content of gravel generally is 0 to 5 percent. It is as much as 35 percent below a depth of 40 inches (102 cm). The content of organic matter is 0.5 to 2 percent and decreases irregularly with increasing depth. Redoximorphic features occur as few or common soft oxidized iron masses. Reaction is neutral or slightly alkaline.

Columbia Taxadjunct

The Columbia taxadjunct consists of very deep, poorly drained soils that formed in alluvium derived from igneous, metamorphic, and sedimentary rocks. These soils are in partially filled oxbows within the meander belt portion of the flood plain along the Sacramento River. Slopes are 0 to 1 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Coarse-loamy, mixed, superactive, nonacid, thermic Aeric Fluvaquents

Typical Pedon

Columbia taxadjunct stratified fine sandy loam, on a slope of 1 percent, under a cover of sedges, hardstem tule, cattail, cocklebur, willow, and California sycamore, at an elevation of 95 feet (29 m). When described on 5/15/1989, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

C1—0 to 8 inches (0 to 20 cm); light brownish gray (10YR 6/2), stratified fine sandy loam, dark grayish brown (10YR 4/2) moist; 10 percent clay; weak medium platy structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine to medium irregular pores; 25 percent fine distinct dark yellowish brown (10YR 4/4 moist) oxidized iron masses; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

C2—8 to 10 inches (20 to 25 cm); light brownish gray (10YR 6/2) fine sandy loam, dark grayish brown (10YR 4/2) moist; 8 percent clay; weak medium platy structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine to medium tubular pores; 16 percent fine distinct dark yellowish brown (10YR 4/4 moist) oxidized iron masses; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

C3—10 to 19 inches (25 to 48 cm); pale brown (10YR 6/3), stratified fine sandy loam, dark grayish brown (10YR 4/2) moist; 9 percent clay; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and common very fine roots; few very fine and fine tubular pores; 15 percent fine distinct dark yellowish brown (10YR 4/4 and 4/6 moist) oxidized iron masses; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

C4—19 to 30 inches (48 to 76 cm); pale brown (10YR 6/3), stratified fine sandy loam, dark brown (10YR 3/3) moist; 9 percent clay; weak medium platy structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and common very fine roots; few very fine and fine tubular pores; 25 percent fine distinct dark yellowish brown (10YR 4/4 and 4/6 moist) oxidized iron masses; slightly alkaline, pH 7.4 by Hellige-Truog; clear smooth boundary.

C5—30 to 40 inches (76 to 102 cm); light olive gray (5Y 6/2), stratified silt loam, dark gray (5Y 4/1) moist; 10 percent clay; weak medium platy structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and common very fine roots; few very fine and fine tubular pores; 25 percent fine prominent dark yellowish brown (10YR 4/4 and 4/6 moist) oxidized iron masses; neutral, pH 7.3 by Hellige-Truog; clear smooth boundary.

C6—40 to 60 inches (102 to 152 cm); pale brown (10YR 6/3), stratified silt loam, dark grayish brown (10YR 4/2) moist; 12 percent clay; weak thin platy structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine roots; 30 percent fine distinct dark yellowish brown (10YR 4/4 and 4/6 moist) oxidized iron masses; neutral, pH 7.3 by Hellige-Truog.

Type location: Butte County, California; about 3.4 miles south of Ord Ferry Bridge, approximately 16,000 feet south of the boundary between T. 20 N. and T. 21 N. and 21,000 feet west of the Mt. Diablo meridian; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 34 minutes, 37 seconds north latitude and 121 degrees, 59 minutes, 22 seconds west longitude; NAD27; USGS Quad: Llano Seco, California.

Range in Characteristics

The soils are more than 60 inches (152 cm) deep. The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 10 to 15 percent clay and 0 to 5 percent rock fragments, mostly well rounded gravel. Mineralogy is mixed. The soils are not calcareous. The content of organic matter is 0.5 to 1.3 percent and decreases irregularly with increasing depth. Base saturation ranges from 90 to 100 percent throughout the profile. A fluctuating water table can occur from the surface to a depth of 24 inches (61 cm) from December through April and is usually below 40 inches (102 cm) from June to November. Redoximorphic features, such as soft oxidized iron masses with color of 10YR 4/4 or 4/6, occur in all horizons. Also, iron depletions with color of 5Y 4/1 occur below a depth of 20 inches (51 cm).

The C horizon has dry color of 10YR 6/2 or 6/3, 2.5Y 6/2, or 5Y 6/2. Moist color is 10YR 3/3, 4/2, or 5/1; 2.5Y 4/2; or 5Y 4/1 or 4/2. Texture is stratified loamy very fine sand, silt loam, or fine sandy loam. The content of clay ranges from 5 to 15 percent. The content of gravel is 0 to 5 percent. Charcoal or organic fragments are common. Reaction is neutral or slightly alkaline.

Some pedons have lenses of sand and/or gravel.

The Columbia taxadjunct is a taxadjunct because it has aquic conditions, chroma of 2 or less, and redoximorphic concentrations at a depth of 16 to 20 inches (41 to 51 cm), which is higher in the profile than is defined as the range for the series. These differences do not significantly affect the use, management, and interpretations of the soils.

Conejo Series

The Conejo series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on distal alluvial fans. Slopes range from 0 to 2 percent. The mean annual precipitation is about 21 inches (533 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Pachic Haploxerolls

Typical Pedon

Conejo clay loam, in an area of milo, at an elevation of 135 feet (41 m); redescribed on 7/20/1993. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); dark gray (10YR 4/1) clay loam, very dark gray (10YR 3/1) moist; 31 percent clay; moderate medium and coarse subangular blocky and strong medium granular structure; very hard, friable, moderately sticky, moderately plastic; many fine and medium irregular pores; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt wavy boundary.

A1—5 to 19 inches (13 to 48 cm); very dark grayish brown (10YR 3/2) clay loam, very dark brown (10YR 2/2) moist; 31 percent clay; moderate coarse subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine roots; many very fine and fine tubular and many fine irregular pores; slightly alkaline, pH 7.5 by Hellige-Truog; clear wavy boundary.

A2—19 to 30 inches (48 to 76 cm); very dark grayish brown (10YR 3/2) clay loam, very dark grayish brown (10YR 3/2) moist; 31 percent clay; moderate medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine roots; many very fine and few fine tubular pores; few pressure faces; common fine iron-manganese nodules about 1 mm in diameter; 1 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; gradual wavy boundary.

Bw1—30 to 48 inches (76 to 122 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 29 percent clay; moderate coarse subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine roots; many very fine and fine tubular and many fine irregular pores; many pressure faces; few fine iron-manganese nodules about 1 mm in diameter; 2 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear wavy boundary.

Bw2—48 to 70 inches (122 to 178 cm); brown (10YR 5/3) sandy loam, dark yellowish brown (10YR 4/4) moist; 19 percent clay; weak fine and medium subangular blocky structure; slightly hard, weakly brittle but friable, nonsticky, slightly plastic; common very fine roots; many very fine and few fine and medium tubular pores; slightly effervescent in seams; common medium oxidized iron masses; 1 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog.

Type location: Butte County, California; about 6 miles south of Chico, on the west side of Aquas Frias Road, approximately 800 feet south of northeast corner of sec. 33, T. 21 N., R. 1 E.; 39 degrees, 38 minutes, 10 seconds north latitude and 121 degrees, 51 minutes, 40 seconds west longitude; NAD27; USGS Quad: Chico, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm). The mean annual soil temperature is 59 to 62 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about May to October (about 140 to 160 days) The particle-size control section averages 27 to 35 percent clay and has some gravel.

Some pedons have overwash of fine sandy loam or loam less than 20 inches (51 cm) thick. These pedons are clay loam or loam in the Ab horizon and in the upper part of the Bw horizon and have 0 to 5 percent gravel and average 18 to 35 percent clay in the particle-size control section. The extent of this overwash phase is about 600 to 700 acres. The overwash is the result of hydraulic mine deposits splaying out of the early levees on Butte Creek, north of Durham.

The Ap and A horizons have dry colors of 10YR 3/2, 4/1, 5/2, or 5/3. Moist color is 10YR 2/2, 3/1, or 3/2. Texture is clay loam. The content of clay ranges from 27 to 35 percent. The content of gravel is 0 to 2 percent. The content of organic matter is 3 to 6 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the Bw horizon has dry colors of 10YR 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 3/2, 3/3, 4/2, or 4/3 or 7.5YR 3/2 or 4/2. Texture is clay loam. The content of clay ranges from 27 to 35 percent. The content of gravel is 0 to 2 percent. Reaction ranges from slightly acid to slightly alkaline.

The lower part of the Bw horizon has dry colors of 10YR 5/3 or 7.5YR 4/2 or 6/4. Moist color is 10YR 4/2, 4/3, 4/4, 5/3, or 5/4. Texture is sandy loam, fine sandy loam, loam, or clay loam. The content of clay ranges from 15 to 35 percent. The content of gravel is 0 to 2 percent. Reaction ranges from neutral to moderately alkaline. In some pedons segregated or secondary lime is at a depth of more than 30 inches (76 cm). Some pedons have redoximorphic features within 40 inches (102 cm) of the surface, and a few pedons have redoximorphic features within 30 inches (76 cm) of the surface.

Coonhollow Series

The Coonhollow series consists of deep, well drained soils that formed in colluvium derived from basalt. These soils are on convex side slopes on basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 5 to 50 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, parasesquic, thermic Pachic Ultic Argixerolls

Typical Pedon

Coonhollow gravelly loam, on a northwest-facing slope of 45 percent, under a cover of hardwoods, shrubs, and annual grasses, at an elevation of 1,020 feet (311 m). When described on 10/31/2000, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (7.5YR 4/3) gravelly loam, dark brown (7.5YR 3/2) moist; 16 percent clay; weak fine granular structure; soft, very friable, nonsticky, nonplastic; many fine roots throughout; many fine irregular pores; 10 percent basalt cobbles and 15 percent basalt gravel; neutral, pH 5.5 by pH meter 1:1 water; clear smooth boundary.

ABt—3 to 11 inches (8 to 28 cm); brown (7.5YR 4/3) very cobbly loam, dark reddish brown (5YR 3/3) moist; 19 percent clay; weak medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and medium roots throughout and few coarse roots between peds; few fine tubular and common fine irregular pores; 10 percent discontinuous distinct clay films on

surfaces along pores; 15 percent basalt gravel and 30 percent basalt cobbles; neutral, pH 5.9 by pH meter 1:1 water; gradual wavy boundary.

Bt1—11 to 22 inches (28 to 56 cm); brown (7.5YR 4/3) very cobbly loam, dark reddish brown (5YR 3/3) moist; 23 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common fine and very coarse roots throughout; common fine tubular and common medium irregular pores; 20 percent discontinuous distinct clay films on surfaces along pores; 15 percent basalt gravel and 40 percent basalt cobbles; neutral, pH 6.1 by pH meter 1:1 water; clear wavy boundary.

Bt2—22 to 32 inches (56 to 81 cm); brown (7.5YR 4/3) extremely cobbly loam, dark reddish brown (5YR 3/3) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common fine and few very fine roots between peds and few very coarse roots throughout; common medium tubular pores; 35 percent discontinuous distinct clay films on surfaces along pores; 15 percent basalt gravel and 50 percent basalt cobbles; slightly acid, pH 6.4 by pH meter 1:1 water; clear wavy boundary.

Bt3—32 to 45 inches (81 to 114 cm); brown (7.5YR 5/3) extremely cobbly clay loam, brown (7.5YR 4/3) moist; 29 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; few fine and common medium roots between peds and common very coarse roots throughout; common medium tubular pores; 45 percent discontinuous distinct clay films on surfaces along pores; 20 percent basalt gravel and 55 percent basalt cobbles; slightly acid, pH 6.4 by pH meter 1:1 water; clear wavy boundary.

Cr—45 to 50 inches (114 to 127 cm); moderately cemented basalt bedrock; abrupt wavy boundary.

R—50 inches (127 cm); indurated basalt bedrock.

Type location: Butte County, California; about 5.1 miles north of downtown Oroville, approximately 1,750 feet east and 1,800 feet north of the southwest corner of sec. 18, T. 20 N., R. 4 E.; 39 degrees, 35 minutes, 18 seconds north latitude and 121 degrees, 34 minutes, 15 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 18 to 27 percent clay and 35 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. The content of organic matter is 1 to 13 percent to a depth of 32 inches (81 cm) and is less than 1 percent from 32 to 50 inches (81 to 127 cm). By ammonium acetate, base saturation ranges from 78 to 91 percent throughout the profile. By sum of cations, it ranges from 55 to 58 percent. Rock fragments on the surface range from 10 to 60 percent gravel, 5 to 65 percent cobbles, 0 to 25 percent stones, and 0 to 20 percent boulders. Some pedons have silty textures.

The A horizon has dry color of 7.5YR 3/4 or 4/3 or 10YR 3/3, 4/3, or 5/3. Moist color is 7.5YR 3/2 or 3/3 or 10YR 2/2, 3/2, or 3/3. Texture is gravelly loam, loam, very gravelly loam, or very cobbly loam. The content of clay ranges from 16 to 22 percent. The horizon has 10 to 55 percent gravel, 5 to 35 percent cobbles, 0 to 45 percent stones, and 0 to 15 percent boulders. Reaction ranges from strongly acid to neutral.

The ABt horizon has dry color of 7.5YR 4/3 or 10YR 5/3 or 5/4. Moist color is 5YR 3/3, 7.5YR 4/3, or 10YR 3/2 or 3/3. Texture is very cobbly loam, loam, gravelly loam, or very gravelly loam. The content of clay ranges from 18 to 22 percent. The horizon has 10 to 50 percent gravel, 5 to 40 percent cobbles, 0 to 55 percent stones, and 0 to 15 percent boulders. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 7.5YR 4/3, 5/3, or 5/4 or 10YR 3/4, 4/3, 4/4, 5/2, or 5/3. Moist color is 5YR 3/3 or 7.5YR 4/3, 3/2, 3/3, or 3/4. Texture is very cobbly loam,

extremely cobbly loam, very cobbly clay loam, extremely cobbly clay loam, gravelly loam, very gravelly loam, gravelly clay loam, very gravelly clay loam, or extremely gravelly clay loam. The content of clay ranges from 18 to 38 percent. The horizon has 15 to 80 percent gravel, 5 to 60 percent cobbles, 0 to 60 percent stones, and 0 to 15 percent boulders. Reaction is slightly acid or neutral.

Coridge Series

The Coridge series consists of moderately deep, moderately well drained soils that formed in residuum derived from basalt. These soils are on the top of ridges on Cascade foothills. Slopes range from 3 to 15 percent. The mean annual precipitation is about 29 inches (736 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Coridge bouldery loam, on a southwest-facing slope of 7 percent, under a cover of Mediterranean barley, soft chess, grasspink, dandelion, and scattered blue oak and foothill pine, at an elevation of 1,030 feet (314 m). When described on 5/20/1998, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); brown (7.5YR 5/4) bouldery loam, brown (7.5YR 4/2) moist; 22 percent clay; moderate medium platy structure parting to moderate fine and medium subangular blocky; hard, friable, slightly sticky, slightly plastic; many very fine roots; few very fine and fine irregular and tubular pores; 10 percent medium irregular oxidized iron masses lining pores; 5 percent gravel and 10 percent boulders; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt1—1 to 6 inches (3 to 15 cm); reddish brown (5YR 5/4) gravelly loam, reddish brown (5YR 4/3) moist; 25 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; common very fine and fine tubular pores; 60 percent discontinuous distinct clay films; 5 percent medium irregular iron-manganese masses between peds; 10 percent boulders and 20 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; gradual smooth boundary.

Bt2—6 to 12 inches (15 to 30 cm); reddish brown (5YR 5/4) gravelly clay loam, reddish brown (5YR 4/3) moist; 29 percent clay; moderate fine and medium subangular blocky structure; extremely hard, friable, slightly sticky, moderately plastic; common very fine and fine and few medium roots; many very fine and fine tubular pores; 60 percent discontinuous distinct clay films; 10 percent boulders and 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

Bt3—12 to 19 inches (30 to 48 cm); reddish brown (5YR 5/4) very gravelly clay loam, reddish brown (5YR 4/3) moist; 35 percent clay; moderate fine and medium subangular blocky structure; extremely hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; common very fine and fine irregular and tubular pores; 60 percent discontinuous distinct clay films; 10 percent boulders, 10 percent cobbles, and 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

Bt4—19 to 24 inches (48 to 61 cm); brown (7.5YR 5/4) very gravelly clay, brown (7.5YR 4/4) moist; 40 percent clay; moderate fine and medium subangular blocky structure; extremely hard, firm, very sticky, very plastic; few very fine to coarse roots; few very fine and fine irregular and tubular pores; 90 percent continuous distinct clay films; 5 percent cobbles, 10 percent boulders, and 35 percent gravel; neutral, pH 6.7 by Hellige-Truog; abrupt smooth boundary.

R—24 inches (61 cm); indurated basalt bedrock.

Type location: Butte County, California; about 1.3 miles west of Richardson Springs, approximately 300 feet north and 850 feet east of the southwest corner of sec. 18, T. 23 N., R. 2 E.; 39 degrees, 50 minutes, 31 seconds north latitude and 121 degrees, 48 minutes, 10 seconds west longitude; NAD27; USGS Quad: Richardson Springs, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 67 degrees F (15 to 19 degrees C). The particle-size control section averages 27 to 35 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the bedrock and 10 inches (25 cm) below the surface of the soil from December through April. Redoximorphic features occur as soft oxidized iron masses in the A horizon, iron-manganese masses in the upper part of the Bt horizon, and iron-manganese masses and nodules in the lower part of the Bt horizon. Rock fragments on the surface range from 5 to 25 percent gravel, 5 to 15 percent cobbles, 5 to 15 percent stones, and 2 to 20 percent boulders.

The A horizon has dry color of 5YR 5/4 or 7.5YR 5/4. Moist color is 5YR 3/3 or 4/3 or 7.5YR 4/2. Texture is gravelly loam, very gravelly loam, or bouldery loam. The content of clay ranges from 20 to 27 percent. The horizon has 5 to 35 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 20 percent boulders. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 5YR 4/4, 5/4, or 5/6. Moist color is 5YR 4/3 or 4/4. Texture is gravelly loam, very gravelly loam, gravelly clay loam, or very gravelly clay loam. The content of clay ranges from 25 to 35 percent. The content of gravel is 15 to 30 percent, the content of cobbles is 0 to 15 percent, the content of stones is 0 to 15 percent, and the content of boulders is 0 to 10 percent. Reaction is slightly acid or neutral.

The lower part of the Bt horizon has dry color of 5YR 4/4 or 4/6 or 7.5YR 5/4. Moist color is 5YR 4/4, 7.5YR 4/4, or 2.5YR 3/4. Texture is very gravelly clay loam, very gravelly clay, or extremely stony clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 10 to 35 percent, the content of cobbles is 5 to 20 percent, the content of stones is 0 to 35 percent, and the content of boulders is 0 to 10 percent. Reaction is slightly acid or neutral.

Craigsaddle Series

The Craigsaddle series consists of deep, well drained soils that formed in residuum and colluvium derived from trondhjemite. These soils are on ridgetops and side slopes on granitic Sierra Nevada foothills. Slopes range from 2 to 70 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Ultic Haploxeralfs

Typical Pedon

Craigsaddle coarse sandy loam, on a southwest-facing slope of 7 percent, under a cover of hardwoods, conifers, and shrubs, at an elevation of 980 feet (299 m). When described on 11/18/1998, the soil was slightly moist to a depth of 21 inches (53 cm) and dry from 21 to 80 inches (53 to 203 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 5 inches (0 to 13 cm); pale brown (10YR 6/3) coarse sandy loam, brown (10YR 4/3) moist; 6 percent clay; weak fine subangular blocky structure parting to single grain; loose, very friable, nonsticky, nonplastic; few fine and common very

fine roots; many very fine interstitial pores; 2 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; abrupt smooth boundary.

Bw1—5 to 11 inches (13 to 28 cm); light gray (10YR 7/2) sandy loam, brown (10YR 4/3) moist; 10 percent clay; weak fine subangular blocky structure parting to single grain; loose, very friable, nonsticky, nonplastic; common fine and few very fine roots; many very fine interstitial pores; 2 percent gravel; strongly acid, pH 5.4 by pH meter 1:1 water; abrupt smooth boundary.

Bw2—11 to 17 inches (28 to 43 cm); pale brown (10YR 6/3) sandy loam, brown (7.5YR 5/4) moist; 10 percent clay; moderate fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common fine and coarse and many medium roots; common very fine and fine tubular pores; 5 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; abrupt smooth boundary.

Bw3—17 to 21 inches (43 to 53 cm); very pale brown (10YR 7/3) sandy loam, brown (7.5YR 5/4) moist; 12 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; few fine and common medium and coarse roots; common very fine and fine tubular pores; 10 percent discontinuous faint clay films on faces of peds; 5 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; clear smooth boundary.

Bt1—21 to 31 inches (53 to 79 cm); pink (7.5YR 7/4) sandy loam, brown (7.5YR 5/4) moist; 19 percent clay; moderate medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few fine and medium roots; many very fine tubular pores; 20 percent discontinuous distinct clay films on faces of peds and in pores; 5 percent gravel; moderately acid, pH 5.7 by pH meter 1:1 water; clear smooth boundary.

Bt2—31 to 51 inches (79 to 130 cm); reddish yellow (7.5YR 7/6) sandy loam, yellowish red (5YR 5/6) moist; 20 percent clay; strong medium subangular blocky structure; very hard, firm, slightly sticky, slightly plastic; few fine and medium roots; many very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds and in pores; 10 percent gravel; moderately acid, pH 5.8 by pH meter 1:1 water; clear smooth boundary.

BCt—51 to 58 inches (130 to 147 cm); pink (7.5YR 8/3) gravelly sandy loam, light brown (7.5YR 6/4) moist; 14 percent clay; moderate medium subangular blocky structure; hard, firm, nonsticky, slightly plastic; few fine roots; common very fine tubular pores; 20 percent discontinuous prominent clay films on faces of peds; 1 percent mica flakes; 25 percent gravel; moderately acid, pH 5.6 by pH meter 1:1 water; gradual wavy boundary.

Cdt—58 to 80 inches (147 to 203 cm); weathered, densic trondhjemite bedrock; pink (7.5YR 8/4) gravelly sandy loam, light brown (7.5YR 6/4) moist; 12 percent clay; massive; very hard, firm, nonsticky, nonplastic; few fine roots; few very fine tubular pores; 25 percent discontinuous prominent clay films on faces of peds; 5 percent mica flakes; 25 percent gravel; moderately acid, pH 5.9 by pH meter 1:1 water.

Type location: Butte County, California; about 2.5 miles east of Bidwell Bar Bridge, approximately 2,150 feet east and 2,000 feet north of the southwest corner of sec. 35, T. 20 N., R. 5 E.; 39 degrees, 32 minutes, 49 seconds north latitude and 121 degrees, 22 minutes, 58 seconds west longitude; NAD83; USGS Quad: Oroville Dam, California.

Range in Characteristics

The depth to densic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The particle-size control section averages 18 to 27 percent clay and 5 to 10 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 2.5 percent to a depth of 5 inches (13 cm) and is less than 1 percent from 5 to 80 inches (13 to 203 cm). By sum of cations, base saturation is less than 75 percent throughout the profile.

Rock fragments on the surface range from 0 to 10 percent gravel. Some pedons do not have a BCt horizon. Some have an O horizon at the surface.

The A horizon has dry color of 10YR 5/2, 6/2, or 6/3. Moist color is 10YR 3/2, 3/3, or 4/3. Texture is coarse sandy loam or sandy loam. The content of clay ranges from 5 to 10 percent. The content of fine gravel is 2 to 10 percent. Reaction ranges from strongly acid to slightly acid.

The Bw horizon has dry color of 10YR 6/2, 6/3, 7/2, or 7/3. Moist color is 10YR 4/2, 4/3, 5/3, or 5/4 or 7.5YR 5/4. Texture is sandy loam, coarse sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 8 to 12 percent. The content of gravel is 2 to 30 percent. Reaction ranges from strongly acid to slightly acid. This horizon is 9 to 32 inches (23 to 81 cm) thick.

The Bt horizon has dry color of 7.5YR 6/4, 6/6, 7/4, or 7/6; 5YR 6/4; or 10YR 7/4. Moist color is 7.5YR 4/6, 5/4, 5/6, or 6/4; 5YR 4/6 or 5/6; or 10YR 5/4. Texture is sandy loam, sandy clay loam, gravelly sandy loam, or gravelly sandy clay loam. The content of clay ranges from 15 to 27 percent. The content of gravel is 0 to 30 percent. Reaction ranges from strongly acid to slightly acid.

The BCt horizon has dry color of 7.5YR 7/4 or 8/3 or 5YR 6/6. Moist color is 7.5YR 5/6 or 6/4 or 2.5YR 4/8. Texture is gravelly sandy loam or sandy clay loam. The content of clay ranges from 13 to 25 percent. The content of gravel is 0 to 25 percent. Reaction ranges from very strongly acid to slightly acid.

The Cdt horizon has dry color of 7.5YR 6/4 or 8/4 or 10YR 7/4. Moist color is 7.5YR 5/4 or 6/4. Texture is gravelly sandy loam or very gravelly sandy clay loam. The content of clay ranges from 12 to 23 percent. The content of gravel is 20 to 50 percent. Reaction is strongly acid or moderately acid.

Crystalhill Series

The Crystalhill series consists of very deep, somewhat excessively drained soils that formed in residuum and colluvium derived from trondhjemite. These soils are on ridgetops and side slopes on granitic Sierra Nevada foothills. Slopes range from 2 to 70 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Coarse-loamy, mixed, active, thermic Typic Haploxerepts

Typical Pedon

Crystalhill gravelly coarse sandy loam, on a northwest-facing slope of 45 percent, under a cover of shrubs, hardwoods, and conifers, at an elevation of 1,740 feet (530 m). When described on 7/17/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed plant material; abrupt smooth boundary.

A—2 to 7 inches (5 to 18 cm); light gray (10YR 7/2) gravelly coarse sandy loam, brown (10YR 5/3) moist; 5 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; common fine roots; many very fine interstitial pores; 25 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bw1—7 to 14 inches (18 to 36 cm); pale brown (10YR 6/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; 8 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; common fine roots; common very fine interstitial pores; 20 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bw2—14 to 22 inches (36 to 56 cm); very pale brown (10YR 7/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; 8 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; few fine roots; common very fine interstitial pores; 25 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; gradual smooth boundary.

Bw3—22 to 33 inches (56 to 84 cm); very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 4/3) moist; 10 percent clay; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; few fine roots; common very fine interstitial pores; 20 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; gradual smooth boundary.

Bw4—33 to 44 inches (84 to 112 cm); very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 4/3) moist; 8 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; few fine roots; common very fine interstitial pores; 30 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

BC—44 to 66 inches (112 to 168 cm); very pale brown (10YR 7/3) sandy loam, brown (10YR 5/3) moist; 5 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; few fine roots; common very fine interstitial pores; 10 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

Cdt—66 inches (168 cm); weathered, densic trondhjemite bedrock; 20 percent continuous prominent clay films in cracks.

Type location: Butte County, California; about 2.7 miles southwest of Featherfalls, approximately 600 feet west and 10 feet north of the southeast corner of sec. 27, T. 20 N., R. 6 E.; 39 degrees, 33 minutes, 24 seconds north latitude and 121 degrees, 16 minutes, 50 seconds west longitude; NAD83; USGS Quad: Forbestown, California.

Range in Characteristics

The depth to densic bedrock is 60 to 80 inches (152 to 203 cm) or more. The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The particle-size control section averages 8 to 18 percent clay and 20 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 2.5 percent to a depth of 7 inches (18 cm) and is less than 1 percent from 7 to 66 inches (18 to 168 cm). Rock fragments on the surface range from 0 to 10 percent gravel.

The A horizon has dry color of 10YR 5/2, 6/2, or 7/2 or 2.5Y 5/3. Moist color is 10YR 3/2, 4/2, 4/3, or 5/3. Texture is gravelly coarse sandy loam, gravelly sandy loam, coarse sandy loam, or sandy loam. The content of clay ranges from 5 to 8 percent. The content of gravel is 2 to 25 percent. Reaction ranges from very strongly acid to slightly acid.

The Bw horizon has dry color of 10YR 6/3, 6/4, 7/3, 7/4, or 8/3; 7.5YR 7/4; or 2.5Y 5/3 or 6/3. Moist color is 10YR 3/3, 4/2, 4/3, 4/4, 5/4, 5/6, or 6/4; 7.5YR 5/4; or 2.5Y 5/3 or 5/4. Texture is gravelly coarse sandy loam, gravelly sandy loam, coarse sandy loam, or sandy loam. The content of clay ranges from 5 to 12 percent. The content of gravel is 5 to 30 percent. Reaction ranges from strongly acid to slightly acid.

The BC horizon has dry color of 10YR 7/3, 7/4, 8/2, 8/3, or 8/4 or 2.5Y 7/3 or 7/4. Moist color is 10YR 5/3, 5/4, 6/3, or 7/4 or 2.5Y 6/4. Texture is sandy loam, gravelly loamy sand, very gravelly loamy coarse sand, loamy sand, coarse sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 1 to 14 percent. The content of gravel is 5 to 55 percent. Reaction ranges from strongly acid to slightly acid.

Dejonah Series

The Dejonah series consists of very deep, well drained soils that formed in tephra-influenced colluvium and residuum derived from metamorphic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 78 inches (1,981 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Fine-loamy, mixed, active, frigid Andic Haplohumults

Typical Pedon

Dejonah gravelly loam, on a northeast-facing slope of 30 percent, under a cover of mixed conifers, red fir, and shrubs, at an elevation of 5,051 feet (1,540 m). When described on 7/14/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 2.5 cm); fresh needles and twigs.

A—1 to 4 inches (2.5 to 10 cm); brown (7.5YR 4/4) gravelly loam, dark reddish brown (5YR 3/3) moist; 14 percent clay; weak fine subangular blocky structure parting to single grain; loose, very friable, nonsticky, nonplastic; many very fine and fine and common coarse roots; many very fine irregular pores; 20 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.5; abrupt smooth boundary.

Bt1—4 to 10 inches (10 to 25 cm); brown (7.5YR 5/4) loam, dark reddish brown (5YR 3/4) moist; 18 percent clay; moderate medium subangular blocky structure; soft, friable, nonsticky, slightly plastic; common very fine to medium roots; few very fine tubular pores; few faint discontinuous clay films on faces of peds; 5 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.5; clear smooth boundary.

2Bt2—10 to 16 inches (25 to 41 cm); brown (7.5YR 5/4) loam, brown (7.5YR 4/4) moist; 21 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and common medium roots; few very fine tubular pores; few faint discontinuous clay films on faces of peds; 5 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.5; clear smooth boundary.

2Bt3—16 to 28 inches (41 to 71 cm); light brown (7.5YR 6/4) loam, brown (7.5YR 4/4) moist; 22 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and coarse and common medium roots; common very fine and fine tubular pores; few faint discontinuous clay films on faces of peds and in pores; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.5; clear smooth boundary.

2Bt4—28 to 37 inches (71 to 94 cm); light brown (7.5YR 6/4) loam, brown (7.5YR 4/4) moist; 16 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and coarse and common medium roots; many very fine tubular pores; few faint discontinuous clay films on faces of peds and in pores; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.0; clear smooth boundary.

2BC1—37 to 53 inches (94 to 135 cm); light yellowish brown (10YR 6/4) sandy loam, dark yellowish brown (10YR 4/4) moist; 12 percent clay; weak fine subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common fine to medium roots; many very fine and fine tubular pores; 30 percent paragravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.0; clear wavy boundary.

2BC2—53 to 60 inches (135 to 152 cm); light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; 14 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; few medium roots; many very fine and fine tubular pores; 50 percent paragravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.0.

Type location: Plumas County, California; about 1.6 miles northwest of Camel Peak Lookout, approximately 1,300 feet west and 2,400 feet north of the southeast corner of sec. 30, T. 22 N., R. 8 E.; 39 degrees, 44 minutes, 11.1 seconds north latitude and 121 degrees, 7 minutes, 24.5 seconds west longitude; NAD83; USGS Quad: American House, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The soil moisture control section is dry in all parts from about August to October (about 60 days). The particle-size control section averages 18 to 27 percent clay and 5 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 5 to 17 percent to a depth of 4 inches (10 cm), 2 to 10 percent from 4 to 16 inches (10 to 41 cm), 1 to 2 percent from 16 to 53 inches (41 to 135 cm), and less than 1 percent from 53 to 60 inches (135 to 152 cm). By sum of cations, base saturation ranges from 10 to 25 percent from 1 to 16 inches (2.5 to 41 cm) and is less than 10 percent from 16 to 60 inches (41 to 152 cm). Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 10 percent cobbles. Some pedons have a C horizon.

The A horizon has dry color of 7.5YR 5/3, 5/4, 6/3, 6/4, or 7/4. Moist color is 7.5YR 3/2, 4/3, or 4/4 or 5YR 3/3, 3/4, 4/4, or 4/6. Texture is loam, sandy loam, gravelly loam, gravelly sandy loam, or very gravelly sandy loam. The content of clay ranges from 10 to 18 percent. The horizon has 5 to 40 percent gravel and 0 to 5 percent cobbles. Acid oxalate extractable Al plus ½ Fe ranges from 1.4 to 2.0. P retention ranges from 80 to 85. The content of glass ranges from 5 to 10 percent. NaF pH is 10.0 to 11.5. Reaction ranges from slightly acid to strongly acid.

The Bt1 horizon has dry color of 7.5YR 5/3, 5/4, 6/3, 6/4, 6/6, or 7/6. Moist color is 7.5YR 4/3, 5/4, or 5/6 or 5YR 3/4, 4/3, 4/6, 5/4, or 5/6. Texture is gravelly loam, gravelly sandy loam, or loam. The content of clay ranges from 18 to 25 percent. The horizon has 5 to 20 percent gravel and 0 to 5 percent cobbles. Acid oxalate extractable Al plus ½ Fe ranges from 1.0 to 1.8. P retention ranges from 65 to 85. The content of glass ranges from 2 to 10 percent. NaF pH is 9.5 to 10.5. Reaction ranges from slightly acid to very strongly acid.

The 2Bt horizon has dry color of 7.5YR 5/4, 6/4, 7/4, or 7/6 or 10YR 7/4, 7/6, 8/4, or 8/6. Moist color is 7.5YR 4/4, 5/4, 5/6, or 6/6 or 10YR 4/4, 5/4, 5/6, or 6/6. Texture is loam, gravelly loam, very gravelly loam, gravelly sandy clay loam, or very gravelly sandy clay loam. The content of clay ranges from 15 to 27 percent. The horizon has 0 to 30 percent gravel, 0 to 15 percent cobbles, and 0 to 30 percent paragravel. NaF pH is 9.0 to 10.0. Reaction ranges from slightly acid to very strongly acid.

The 2BC horizon has dry color of 10YR 6/4, 7/6, or 8/6. Moist color is 10YR 4/4 or 6/6 or 7.5YR 6/6 or 6/8. Texture is loam, sandy loam, gravelly loam, or extremely gravelly sandy loam. The content of clay ranges from 8 to 20 percent. The horizon has 0 to 80 percent gravel, 0 to 20 percent cobbles, and 0 to 50 percent paragravel. NaF pH is less than 9.0. Reaction ranges from moderately acid to very strongly acid.

Dixmine Series

The Dixmine series consists of deep, well drained soils that formed in residuum and colluvium derived from metavolcanic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 71 inches (1,803 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Clayey-skeletal, parasesquic, mesic Typic Haploxerults

Typical Pedon

Dixmine very gravelly loam, on a west-southwest-facing slope of 36 percent, under a cover of Douglas-fir, ponderosa pine, sugar pine, white fir, California black oak, and tanoak, at an elevation of 2,970 feet (905 m). When described on 10/15/1997, the soil was dry to a depth of 17.5 inches (44 cm) and very slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); needles, leaves, and twigs.
Oe—1 to 2 inches (3 to 4 cm); partially decomposed needles, leaves, and twigs.
A—2 to 6 inches (4 to 14 cm); reddish yellow (7.5YR 6/6) very gravelly loam, brown (7.5YR 4/4) moist; 24 percent clay; strong fine granular structure; soft, friable, slightly sticky, slightly plastic; many very fine and common fine and medium roots; many very fine to medium and common coarse irregular and tubular pores; noneffervescent; 35 percent gravel; slightly acid, pH 6.2 by pH meter 1:1 water; clear smooth boundary.
Bt1—6 to 11 inches (14 to 29 cm); reddish yellow (7.5YR 6/6) very gravelly loam, brown (7.5YR 4/4) moist; 24 percent clay; strong fine and medium granular structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium and common coarse irregular and tubular pores; many distinct discontinuous clay films on faces of peds; noneffervescent; 30 percent gravel and 5 percent cobbles; moderately acid, pH 5.9 by pH meter 1:1 water; gradual smooth boundary.
Bt2—11 to 17 inches (29 to 44 cm); reddish yellow (5YR 6/6) gravelly loam, reddish brown (5YR 4/4) moist; 23 percent clay; strong fine and medium granular structure; soft, friable, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; many very fine to medium and common coarse irregular and tubular pores; many distinct discontinuous clay films on faces of peds; noneffervescent; 20 percent gravel and 10 percent cobbles; moderately acid, pH 5.8 by pH meter 1:1 water; clear smooth boundary.
Bt3—17 to 30 inches (44 to 75 cm); reddish yellow (5YR 6/6) very cobbly clay loam, yellowish red (5YR 4/6) moist; 35 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine and fine and common medium tubular pores; many distinct continuous clay films on faces of peds; noneffervescent; 20 percent gravel and 25 percent cobbles; strongly acid, pH 5.5 by pH meter 1:1 water; gradual smooth boundary.
Bt4—30 to 41 inches (75 to 103 cm); reddish yellow (5YR 6/6) very gravelly clay loam, yellowish red (5YR 4/6) moist; 35 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; many prominent continuous clay films on faces of peds; noneffervescent; 30 percent gravel and 25 percent cobbles; strongly acid, pH 5.4 by pH meter 1:1 water; gradual smooth boundary.
Bt5—41 to 54 inches (103 to 136 cm); reddish yellow (5YR 6/6) extremely cobbly clay loam, yellowish red (5YR 4/6) moist; 28 percent clay; moderate medium subangular blocky structure; soft, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; many distinct continuous clay films on faces of peds; noneffervescent; 30 percent gravel and 35 percent cobbles; strongly acid, pH 5.3 by pH meter 1:1 water; abrupt wavy boundary.
Cr—54 inches (136 cm); very weathered, moderately cemented metatuff; beds occurring less than 4 inches (10 cm) apart; roots occurring more than 4 inches (10 cm) apart.

Type location: Butte County, California; about 2.1 miles north-northeast of Platte Mountain, approximately 1,500 feet north and 1,500 feet east of the southwest corner of sec. 3, T. 24 N., R. 3 E.; 39 degrees, 57 minutes, 49.77 seconds north latitude and 121 degrees, 37 minutes, 52.52 seconds west longitude; NAD83; USGS Quad: Cohasset, California

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 (102 to 152 cm) inches. The mean annual soil temperature is 50 to 57 degrees F (10 to 14 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 35 to 40 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is parasesquic. Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones.

The A horizon has dry color of 7.5YR 5/4, 6/4, 6/6, or 7/4. Moist color is 7.5YR 3/4 or 4/4 or 5YR 4/3. Texture is very gravelly loam or gravelly loam. The content of clay ranges from 18 to 27 percent. The horizon has 15 to 50 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 4 to 8 percent. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 5/4, 6/4, 6/6, or 7/6 or 5YR 5/6, 6/4, or 6/6. Moist color is 7.5YR 3/4, 4/4, 4/6, 5/4, or 5/6 or 5YR 4/3, 4/4, or 4/6. Texture is gravelly loam, very gravelly loam, or gravelly clay loam. The content of clay ranges from 20 to 30 percent. The content of gravel is 15 to 35 percent, and the content of cobbles is 0 to 20 percent. The content of organic matter is 2 to 5 percent. Reaction ranges from strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 7.5YR 5/4, 6/6, or 7/6; 5YR 5/6 or 6/6; or 2.5YR 5/6 or 7/6. Moist color is 7.5YR 5/4, 5/6, or 6/6; 5YR 4/6 or 5/6; or 2.5YR 3/4 or 4/6. Texture is very gravelly clay loam, very cobbly clay loam, or extremely cobbly clay loam. The content of clay ranges from 27 to 40 percent. The content of gravel is 15 to 60 percent, and the content of cobbles is 0 to 35 percent. The content of organic matter is 0.2 to 2 percent. Reaction ranges from very strongly acid to moderately acid.

Dodgeland Series

The Dodgeland series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in overflow channels and flood basins. Slopes range from 0 to 5 percent. The mean annual precipitation is about 19 inches (483 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Endoaquerts

Typical Pedon

Dodgeland silty clay loam, on a slope of 1 percent, under a cover of rice stubble, at an elevation of 105 feet (32 m). When described on 9/13/1994, the soil was slightly moist below a depth of 8 inches (20 cm) and moist from 8 to 53 inches (20 to 135 cm). The water table was at a depth of 120 inches (305 cm). (Colors are for dry soil unless otherwise noted).

Ap1—0 to 4 inches (0 to 10 cm); light brownish gray (10YR 6/2) silty clay loam, dark gray (10YR 4/1) moist; 39 percent clay; moderate medium subangular blocky structure parting to moderate fine granular; slightly hard, very friable, moderately sticky, moderately plastic; many fine and common very fine roots; common fine irregular and common very fine tubular pores; common fine prominent strong brown (7.5YR 4/6 moist) irregular oxidized iron masses lining pores; common fine

prominent black (N 2/0 moist) irregularly shaped iron-manganese masses between peds; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Ap2—4 to 8 inches (10 to 20 cm); gray (10YR 5/1) silty clay, very dark grayish brown (10YR 3/2) moist; 41 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common very fine and fine and few coarse roots; few very fine tubular pores; many medium prominent strong brown (7.5YR 4/6 moist) irregular oxidized iron masses throughout; common fine prominent black (N 2/0 moist) irregular iron-manganese masses between peds; 1 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bss1—8 to 18 inches (20 to 46 cm); grayish brown (10YR 5/2) silty clay, dark grayish brown (10YR 4/2) moist; 49 percent clay; weak medium prismatic structure parting to moderate fine angular blocky; extremely hard, extremely firm, very sticky, very plastic; few very fine and fine roots; few very fine tubular pores; common fine prominent brown (7.5YR 4/4 moist) irregular oxidized iron masses throughout; common fine prominent black (N 2/0 moist) irregular iron-manganese masses throughout; common fine prominent light brownish gray (10YR 6/2) irregular iron depletions throughout; few slickensides; 1 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bss2—18 to 33 inches (46 to 84 cm); brown (10YR 5/3) silty clay, dark grayish brown (10YR 4/2) moist; 51 percent clay; weak coarse prismatic structure parting to moderate fine angular blocky; extremely hard, extremely firm, very sticky, very plastic; few very fine and fine roots; few very fine tubular pores; common fine prominent brown (7.5YR 4/4 moist) irregular oxidized iron masses throughout; common fine prominent black (N 2/0 moist) irregular iron-manganese masses throughout; common fine prominent light brownish gray (10YR 6/2 moist) irregular iron depletions lining pores; common slickensides; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bss3—33 to 45 inches (84 to 114 cm); brown (10YR 5/3) silty clay, brown (10YR 4/3) moist; 49 percent clay; moderate medium angular blocky structure; very hard, very firm, moderately sticky, moderately plastic; few very fine roots; few very fine tubular pores; common fine prominent brown (7.5YR 4/4 moist) irregular oxidized iron masses of throughout; few fine prominent black (N 2/0 moist) iron-manganese masses throughout; common fine prominent light brownish gray (10YR 6/2 moist) irregular iron depletions lining pores; common slickensides; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bkss—45 to 53 inches (114 to 135 cm); light yellowish brown (10YR 6/4) silty clay, brown (10YR 4/3) moist; 41 percent clay; moderate fine angular blocky structure; very hard, very firm, moderately sticky, moderately plastic; few very fine roots; common very fine tubular pores; common fine prominent light brownish gray (10YR 6/2 moist) threadlike iron depletions lining pores; few slickensides; common fine distinct white (10YR 8/2) carbonate concretions between peds and common fine distinct white (10YR 8/2) carbonate threads on faces of peds and in pores; violently effervescent; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt smooth boundary.

2Bw1—53 to 60 inches (135 to 152 cm); light yellowish brown (10YR 6/4) silty clay loam, brown (10YR 4/3) moist; 33 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; few fine and common very fine tubular pores; common fine and medium prominent light brownish gray (10YR 6/2 moist) threadlike iron depletions lining pores; slightly alkaline, pH 7.8 by Hellige-Truog; clear smooth boundary.

2Bw2—60 to 70 inches (152 to 178 cm); very pale brown (10YR 7/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; 29 percent clay; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky, slightly plastic;

few very fine roots; common fine tubular pores; common fine and medium prominent light brownish gray (10YR 6/2 moist) threadlike iron depletions lining pores; slightly alkaline, pH 7.8 by Hellige-Truog; gradual smooth boundary.

2Bw3—70 to 80 inches (178 to 203 cm); very pale brown (10YR 7/4) silty clay loam, dark yellowish brown (10YR 4/4) moist; 33 percent clay; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky, slightly plastic; few very fine roots; common very fine and few fine tubular pores; common fine distinct black (N 2/0 moist) irregular manganese masses throughout; slightly alkaline, pH 7.8 by Hellige-Truog.

Type location: Butte County, California; about 5.8 miles southwest of Dayton, approximately 14,620 feet north and 2,050 feet west of the northwest corner of sec. 1, T. 19 N., R. 1 W.; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 34 minutes, 7 seconds north latitude and 121 degrees, 56 minutes, 12 seconds west longitude; NAD27; USGS Quad: Llano Seco, California.

Range in Characteristics

Depth to the duripan is more than 80 inches (203 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from May to October 15 (about 165 days). The particle-size control section averages 40 to 60 percent clay. Mineralogy is dominantly smectitic. The content of organic matter is 1 to 2 percent to a depth of 45 inches (114 cm). Reversible, surface-initiated cracks 0.25 to 1 inch wide extend to a depth of 33 inches (84 cm) from June 15 to October 1 (about 105 days) when the soils are not irrigated. Few or common intersecting slickensides occur in the Bss and Bkss horizons, from 8 to 53 inches (20 to 135 cm). A fluctuating water table can occur at a depth of 0 to 60 inches (0 to 152 cm) from December through April. Some pedons have thin strata of sandy loam between the Ap and Bss horizons.

The Ap1 horizon has dry color of 10YR 5/1, 5/2, 6/2, or 6/3. Moist color is 10YR 3/2, 3/3, 4/1, or 4/2. The content of clay ranges from 30 to 40 percent. The content of gravel is 0 to 5 percent. Redoximorphic features occur as oxidized iron masses and iron-manganese masses. Reaction is slightly acid or moderately acid because of applications of fertilizer.

The Ap2 horizon has dry color of 10YR 5/1, 5/2, or 5/3. Moist color is 10YR 3/2, 4/2, or 4/3. Texture is silty clay or clay. The content of clay ranges from 40 to 45 percent. The content of gravel is 0 to 5 percent. Redoximorphic features occur as oxidized iron masses, iron-manganese masses, manganese nodules, and iron depletions. Reaction is slightly acid or neutral.

The Bss horizon has dry color of 10YR 5/2, 5/3, or 6/3. Moist color is 10YR 4/2, 4/3, or 4/4. Texture is silty clay or clay. The content of clay ranges from 45 to 55 percent. The content of gravel is 0 to 5 percent. Redoximorphic features occur as oxidized iron masses, iron-manganese masses, manganese nodules, and iron depletions. Reaction is neutral or slightly alkaline.

The Bkss horizon has dry color of 10YR 6/3, 6/4, 5/3, 4/3, or 4/2. Moist color is 10YR 3/3, 3/4, or 4/3. Texture is silty clay or clay. The content of clay ranges from 40 to 55 percent. Redoximorphic features occur as iron-manganese masses and iron depletions. Electrical conductivity ranges from 0 to 2 mmhos/cm. The content of calcium carbonate is 0 to 1 percent. Reaction is slightly alkaline or moderately alkaline.

The 2Bw horizon has dry color of 10YR 6/4 or 7/4. Moist color is 4/3 or 4/4. Texture is silty clay loam or silt loam. The content of clay ranges from 18 to 35 percent. Redoximorphic features occur as iron-manganese masses and iron depletions. Reaction is slightly alkaline or moderately alkaline.

Doemill Series

The Doemill series consists of shallow, somewhat poorly drained soils that formed in residuum derived from volcanic mudflow breccia. These soils are on mounds and in convex areas on ridgetops and side slopes on volcanic ridges on Cascade foothills. Slopes range from 0 to 30 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy, mixed, superactive, thermic Lithic Haploxeralfs

Typical Pedon

Doemill gravelly loam, on a west-facing slope of 3 percent, under a cover of annual grasses and forbs, at an elevation of 319 feet (97 m). When described on 3/26/1997, the soil was dry from 0 to 1 inch (0 to 2.5 cm) and slightly moist from 1 to 14 inches (2.5 to 36 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 2.5 cm); strong brown (7.5YR 5/6) gravelly loam, dark reddish brown (2.5YR 3/4) moist; 19 percent clay; moderate thin and medium platy structure parting to moderate fine subangular blocky; slightly hard, friable, nonsticky, slightly plastic; many very fine and few fine roots; few very fine tubular and common very fine irregular pores; noneffervescent; 15 percent gravel; slightly acid, pH 6.1 by pH meter 1:1 water; clear smooth boundary.

Bt1—1 to 5 inches (2.5 to 13 cm); yellowish red (5YR 5/6) gravelly loam, dark reddish brown (2.5YR 3/4) moist; 23 percent clay; moderate medium subangular blocky structure; moderately hard, firm, slightly sticky, slightly plastic; common very fine and few fine roots; common very fine vesicular and tubular pores; common distinct discontinuous clay films on faces of peds; noneffervescent; 20 percent gravel; neutral, pH 6.8 by pH meter 1:1 water; gradual smooth boundary.

Bt2—5 to 9 inches (13 to 23 cm); yellowish red (5YR 5/6) gravelly loam, dark reddish brown (2.5YR 3/4) moist; 24 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and few fine roots; common very fine and few fine vesicular and tubular pores; common distinct discontinuous clay films on faces of peds; noneffervescent; 15 percent gravel; neutral, pH 6.7 by pH meter 1:1 water; gradual smooth boundary.

Bt3—9 to 14 inches (23 to 36 cm); yellowish red (5YR 5/6) gravelly loam, dark reddish brown (2.5YR 3/4) moist; 26 percent clay; moderate medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine and common fine vesicular and tubular pores; common distinct discontinuous clay films on faces of peds; noneffervescent; 20 percent gravel and 10 percent cobbles; neutral, pH 6.7 by pH meter 1:1 water; abrupt smooth boundary.

R—14 inches (36 cm); indurated volcanic mudflow breccia; matted roots on the surface of the bedrock; 1/16-inch (2-mm) manganese capping.

Type location: Butte County, California; about 0.7 mile north of Rock Creek Road and about 2.8 miles east of Meridian Road, approximately 1,600 feet south and 750 feet west of the northeast corner of sec. 16, T. 23 N., R. 1 E.; 39 degrees, 51 minutes, 3.57 seconds north latitude and 121 degrees, 51 minutes, 54.65 seconds west longitude; NAD83; USGS Quad: Richardson Springs, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 200 days). The particle-size control section averages 18 to 27 percent clay and 2 to 35 percent rock

fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the bedrock and 2 inches (5 cm) below the surface of the soil from November through March. Redoximorphic features, such as iron-manganese masses, occur in the Bt horizon. Also, manganese accumulations occur in layers 1/16 to 1/8 inch thick on top of the bedrock. Rock fragments on the surface range from 0 to 20 percent gravel, 2 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 5 percent boulders. Some pedons have an organic mat, 1/16 inch (2 mm) thick, on the surface.

The A horizon has dry color of 5YR 4/6 or 5/6 or 7.5YR 5/6. Moist color is 2.5YR 3/4; 5YR 3/3, 3/4, 4/3, or 4/4; or 7.5YR 3/3. Texture is loam or gravelly loam. The content of clay ranges from 15 to 24 percent. The horizon has 1 to 15 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 5/6 or 7.5YR 5/6. Moist color is 2.5YR 3/3 or 3/4 or 5YR 3/3, 3/4, or 4/4. Texture is loam, gravelly loam, cobbly loam, gravelly clay loam, or very gravelly clay loam. The content of clay ranges from 18 to 30 percent. The horizon has 2 to 20 percent gravel, 0 to 20 percent cobbles, and 0 to 10 percent stones. Reaction is slightly acid or neutral.

Dunstone Series

The Dunstone series consists of shallow, well drained soils that formed in residuum and colluvium derived from metavolcanic rocks, mainly greenschist and metasedimentary rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 1 to 90 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy, mixed, superactive, thermic, shallow Ultic Haploxeralfs

Typical Pedon

Dunstone loam, on a west-facing slope of 6 percent, under a cover of annual grasses and forbs, at an elevation of 725 feet (223 m). When described on 7/12/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/4) loam, dark brown (7.5YR 3/4) moist; 15 percent clay; moderate very fine and fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; many very fine roots; common very fine tubular pores; 20 percent fine irregular yellowish red (5YR 5/6) oxidized iron masses throughout; 2 percent subangular metavolcanic gravel; very strongly acid, pH 5.0 by Hellige-Truog; abrupt smooth boundary.

BAt—2 to 7 inches (5 to 18 cm); strong brown (7.5YR 5/6) loam, yellowish red (5YR 4/6) moist; 17 percent clay; moderate fine subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 5 percent discontinuous faint clay films on faces of peds and in pores; 3 percent subangular metavolcanic gravel; slightly acid, pH 6.6 by Hellige-Truog; clear wavy boundary.

Bt1—7 to 10 inches (18 to 25 cm); strong brown (7.5YR 5/6) loam, yellowish red (5YR 4/6) moist; 22 percent clay; moderate fine subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 10 percent discontinuous faint clay films on faces of peds and in pores; 3 percent subangular metavolcanic gravel; neutral, pH 6.7 by Hellige-Truog; clear wavy boundary.

Bt2—10 to 16 inches (25 to 41 cm); strong brown (7.5YR 5/6) loam, yellowish red (5YR 4/6) moist; 24 percent clay; moderate medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; common very fine

roots; many very fine and fine tubular pores; 10 percent discontinuous faint clay films on faces of peds and in pores; 5 percent subangular metavolcanic gravel; neutral, pH 6.8 by Hellige-Truog; clear wavy boundary.

Cr—16 to 20 inches (41 to 51 cm); moderately cemented, weathered greenschist.

Type location: Butte County, California; about 1.5 miles north of Wyandotte, approximately 2,500 feet south and 1,950 feet east of the northwest corner of sec. 30, T. 19 N., R. 5 E.; 39 degrees, 28 minutes, 33.42 seconds north latitude and 121 degrees, 27 minutes, 20.99 seconds west longitude: NAD83; USGS Quad: Bangor, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 18 to 27 percent clay and 3 to 30 percent rock fragments, mostly gravel. The content of silt can be as high as 50 percent. Mineralogy is mixed. Rock fragments on the surface range from 0 to 5 percent cobbles, 0 to 2 percent stones, and 0 to 1 percent boulders. Some pedons have a BCt horizon.

The A horizon has dry color of 7.5YR 4/4, 4/6, 5/4, 5/6, 6/4, or 6/6 or 5YR 4/4 or 4/6. Moist color is 7.5YR 3/3, 3/4, 4/3, or 4/4 or 5YR 3/3, 3/4, or 4/4. Texture is loam, silt loam, gravelly silt loam, or gravelly loam. The content of clay ranges from 12 to 22 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 1 to 8 percent. Reaction ranges from very strongly acid to slightly acid.

The BAt horizon has dry color of 7.5YR 5/4 or 5/6 or 5YR 4/6. Moist color is 7.5YR 4/3 or 3/4 or 5YR 3/3, 3/4, 3/6, 4/4, or 4/6. Texture is loam or gravelly loam. The content of clay ranges from 16 to 22 percent. The horizon has 3 to 30 percent gravel and 0 to 5 percent cobbles. By sum of cations, base saturation ranges from 65 to 74 percent. The content of organic matter is 1 to 2 percent. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 7.5YR 4/6, 5/4, 5/6, 6/4, or 6/6 or 5YR 4/6 or 5/6. Moist color is 7.5YR 3/4 or 4/4 or 5YR 3/4, 3/6, or 4/4. Texture is loam, gravelly loam, silt loam, gravelly silt loam, clay loam, or gravelly clay loam. The content of clay ranges from 15 to 27 percent. The content of gravel is 0 to 30 percent, and the content of cobbles is 0 to 5 percent. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 0.5 to 2 percent. Reaction ranges from moderately acid to neutral.

The lower part of the Bt horizon has dry color of 7.5YR 4/6, 5/6, or 6/6; 5YR 4/6 or 5/6; or 2.5YR 5/6. Moist color is 7.5YR 4/6, 5YR 3/4 or 4/4, or 2.5YR 3/6. Texture is loam, silt loam, gravelly loam, very gravelly loam, clay loam, gravelly clay loam, or very gravelly clay loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 0 to 45 percent, and the content of cobbles is 0 to 5 percent. By sum of cations, base saturation ranges from 74 to 85 percent. The content of organic matter is 0.5 to 2 percent. Reaction ranges from moderately acid to neutral.

Duraquerts

Duraquerts consist of moderately deep, poorly drained soils that formed in alluvium derived from igneous rocks. These soils are in swales on fan terraces. Slopes are 0 to 1 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Duraquerts

Typical Pedon

Duraquerts gravelly clay, on a slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 194 feet (59 m). When described on 4/25/2001, the soil was slightly moist from the surface to 3 inches (0 to 8 cm) and moist from 3 to 23 inches (8 to 58 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); very dark gray (10YR 3/1) gravelly clay, very dark grayish brown (10YR 3/2) moist; 45 percent clay; moderate medium subangular blocky structure parting to moderate very fine granular; very hard, very firm, very sticky, very plastic; many very fine roots; common fine irregular pores; 15 percent oxidized iron masses on surfaces along root channels; 2 percent well rounded mixed cobbles and 20 percent well rounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

A2—3 to 6 inches (8 to 15 cm); dark gray (10YR 4/1) gravelly silty clay, very dark gray (10YR 3/1) moist; 50 percent clay; moderate medium subangular blocky structure parting to moderate very fine granular; extremely hard, extremely firm, very sticky, very plastic; few fine and common very fine roots; few very fine tubular pores; oxidized iron masses; 20 percent well rounded mixed gravel; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

Bss1—6 to 15 inches (15 to 38 cm); dark gray (10YR 4/1) silty clay, dark grayish brown (10YR 4/2) moist; 55 percent clay; moderate coarse prismatic structure parting to moderate fine angular blocky; extremely hard, extremely firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; 20 percent slickensides; 10 percent well rounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bss2—15 to 21 inches (38 to 53 cm); dark gray (10YR 4/1) silty clay, dark grayish brown (10YR 4/2) moist; 55 percent clay; weak medium angular blocky structure; extremely hard, extremely firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; 10 percent slickensides; 10 percent well rounded mixed gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Bw—21 to 23 inches (53 to 58 cm); brown (10YR 5/3) very gravelly silty clay, brown (10YR 4/3) moist; 55 percent clay; weak fine angular blocky structure; extremely hard, extremely firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; 40 percent very fine irregular manganese masses around rock fragments; 50 percent well rounded mixed gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

2Bq1—23 to 27 inches (58 to 69 cm); weakly cemented duripan; yellow (10YR 7/6) very gravelly sandy loam, dark yellowish brown (10YR 4/4) moist; 10 percent clay; massive; weakly cemented by silica; 50 percent well rounded mixed gravel; abrupt smooth boundary.

2Bq2—27 to 32 inches (69 to 81 cm); extremely weakly cemented duripan; yellow (10YR 7/6) extremely gravelly sandy loam, dark yellowish brown (10YR 4/6) moist; 10 percent clay; massive; extremely weakly cemented by silica; 65 percent well rounded mixed gravel; abrupt smooth boundary.

2Bq3—32 to 39 inches (81 to 99 cm); very weakly cemented duripan; yellow (10YR 7/6) extremely gravelly sandy loam, dark yellowish brown (10YR 4/6) moist; 10 percent clay; massive; very weakly cemented by silica; 10 percent well rounded mixed cobbles and 60 percent well rounded mixed gravel; abrupt smooth boundary.

2Bq4—39 to 60 inches (99 to 152 cm); very weakly cemented duripan; yellow (10YR 7/6) extremely gravelly sandy loam, dark yellowish brown (10YR 4/6) moist; 10 percent clay; massive; very weakly cemented by silica; 10 percent well rounded mixed cobbles and 60 percent well rounded mixed gravel.

Type location: Butte County, California; about 4.5 miles northwest of Oroville, approximately 1,500 feet east and 500 feet north of the southwest corner of sec. 27,

T. 20 N., R. 3 E.; 39 degrees, 33 minutes, 15 seconds north latitude and 121 degrees, 37 minutes, 40 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 50 to 55 percent clay and 10 to 20 percent rock fragments, mostly gravel. Mineralogy is smectitic. The content of organic matter is 1 to 2 percent in the A horizon and less than 1 percent in the Bss and Bw horizons. Reversible, surface-initiated cracks 1 to 1.5 inches (3 to 4 cm) wide extend to a depth of 21 inches (53 cm) from May to October. Slickensides range from 10 to 20 percent in the Bss horizon, from 6 to 21 inches (15 to 53 cm). A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through May. Rock fragments on the surface range from 0 to 10 percent gravel and 2 to 25 percent cobbles.

The A horizon has dry color of 10YR 3/1, 4/1, or 5/2. Moist color is 10YR 3/1, 3/2, or 4/2. Texture is gravelly clay, gravelly silty clay, or clay. The content of clay ranges from 40 to 50 percent. The horizon has 5 to 20 percent gravel and 0 to 2 percent cobbles. Redoximorphic features range from 15 to 20 percent oxidized iron masses. Reaction is moderately acid or slightly acid.

The Bss horizon has dry color of 10YR 4/1 or 5/2. Moist color is 10YR 4/1 or 4/2. Texture is silty clay or clay. The content of clay ranges from 45 to 55 percent. The horizon has 5 to 10 percent gravel and 0 to 2 percent cobbles. Redoximorphic features range from 0 to 2 percent iron-manganese nodules, 0 to 10 percent oxidized iron masses, and 10 to 35 percent iron-manganese masses. Reaction ranges from slightly acid to moderately alkaline.

The Bw horizon has dry color of 10YR 5/3, 6/3, or 6/4. Moist color is 10YR 4/3, 4/4, or 5/4. Texture is very gravelly silty clay or gravelly clay. The content of clay ranges from 50 to 55 percent. The horizon has 20 to 50 percent gravel and 0 to 10 percent cobbles. Redoximorphic features range from 0 to 2 percent iron-manganese masses and 0 to 2 percent iron-manganese nodules. Reaction ranges from neutral to moderately alkaline.

The 2Bq horizon has dry color of 10YR 7/6. Moist color is 10YR 4/3 or 5/4. Texture is very gravelly or extremely gravelly sandy loam. The content of clay ranges from 5 to 10 percent. The horizon has 50 to 65 percent gravel and 0 to 10 percent cobbles. Redoximorphic features range from 2 to 5 percent manganese surface coatings on top of the horizon. Reaction ranges from neutral to moderately alkaline. Cementation ranges from extremely weak to weak.

Duric Xerarents

Duric Xerarents consist of shallow to deep, moderately well drained to poorly drained, anthropogenic (altered) soils that formed during the process of land-leveling. The cut and fill material (human-altered and human-transported material) is reworked alluvium weathered from igneous and metamorphic rocks. These soils are on anthropogenic-altered intermediate and low terraces. Slopes are 0 to 1 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Thermic Duric Xerarents

Reference Pedon

Duric Xerarents fine sandy loam, on a slope of less than 1 percent, in a fallowed field, under a cover of annual grasses and forbs, at an elevation of 135 feet (41 m). When

described on 5/28/1992, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); brownish yellow (10YR 6/6) fine sandy loam, dark yellowish brown (10YR 4/4) moist; 18 percent clay; moderate very fine and fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; many very fine roots; few very fine tubular pores; 10 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

C/Bt/Bqm—5 to 12 inches (13 to 30 cm); brownish yellow (10YR 6/6) and reddish yellow (7.5YR 6/6) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; 12 percent clay; moderate fine angular blocky structure; very hard, firm, nonsticky, nonplastic; brittle; common very fine roots; 5 percent clay films on faces of peds; 50 percent gravel; up to 20 percent duripan fragments; neutral, pH 7.0 by Hellige-Truog; abrupt irregular boundary.

2Bqmb—12 to 19 inches (30 to 46 cm); indurated duripan; yellowish brown (5YR 5/6), cemented extremely gravelly material, dark reddish brown (5YR 3/4) moist; extremely hard, brittle; few very fine roots; 20 percent manganese coatings; 80 percent gravel; slightly alkaline, pH 7.7 by Hellige-Truog.

The reference pedon is an example of the soils within this category. It is not necessarily representative of the soils throughout the survey area. The texture, color, content of rock fragments, and thickness of layers vary considerably from one area to another.

Type location: Butte County, California; about 5.3 miles northwest of Oroville, approximately 2,100 feet north and 1,100 feet east of the southwest corner of sec. 5, T. 19 N., R. 3 E.; 39 degrees, 31 minutes, 47 seconds north latitude and 121 degrees, 39 minutes, 55 seconds west longitude; NAD27; USGS Quad: Shippee, California.

Range in Characteristics

In cut areas depth to the duripan ranges from 4 to 22 inches (15 to 56 cm), and in fill areas it ranges from 24 to 80 inches (61 to 203 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 12 to 50 percent clay and 10 to 50 percent rock fragments, mostly gravel. Mineralogy is mixed or smectitic. Texture varies because of cutting and filling. The content of organic matter is 0 to 2 percent to a depth of 80 inches (203 cm). A fluctuating water table can occur between the surface of the soil and a depth of 80 inches (0 to 203 cm) from December through April. Redoximorphic features, such as manganese coatings and oxidized iron masses, may occur in all horizons. Rock fragments on the surface range from 0 to 10 percent gravel.

The Ap or Ab horizon has dry color of 10YR 5/2, 5/3, 6/3, 6/4, or 6/6. Moist color is 10YR 3/1, 3/2, 3/3, 3/4, 4/2, 4/3, or 4/4 or 7.5YR 4/6. Texture is fine sandy loam, gravelly sandy loam, clay loam, sandy clay loam, sandy loam, clay, loam, or gravelly sandy clay loam. The content of clay ranges from 10 to 45 percent. The content of gravel is 0 to 35 percent. Reaction ranges from strongly acid to neutral.

The C/Bt/Bqm horizon has dry color of 10YR 6/4 or 6/6 or 7.5YR 6/4. Moist color is 10YR 3/3 or 5/4 or 7.5YR 4/2, 3/4, or 4/4. Texture is very gravelly sandy loam, sandy clay loam, sandy clay, or clay. The content of clay ranges from 12 to 55 percent. The content of gravel is 10 to 50 percent. Reaction ranges from neutral to moderately alkaline.

The Bt or Btb horizon, where it occurs, has dry color of 10YR 5/3, 6/3, 6/4, 6/6, or 7/3 or 7.5YR 5/3, 6/3, or 6/4. Moist color is 10YR 3/3, 3/4, 3/6, 4/2, 4/3, 4/4, 5/4, or 5/6 or 7.5YR 3/2, 3/4, 4/2 4/3, 4/4, or 4/6. Texture is very gravelly sandy loam, sandy loam, clay loam, sandy clay loam, sandy clay, or clay. The content of clay ranges from 12 to 55 percent. The content of gravel is 0 to 50 percent. Reaction ranges from slightly acid to moderately alkaline.

The 2Bt horizon, where it occurs, has dry color of 10YR 4/3, 5/4, 6/4, or 6/6 or 7.5YR 6/4. Moist color is 10YR 4/2, 4/4, or 5/4 or 7.5YR 3/4, 4/2, 4/3, 4/4, or 4/6. Texture is sandy clay or clay. The content of clay ranges from 40 to 55 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to moderately alkaline.

Durixeralfs

Durixeralfs consist of very shallow to moderately deep, somewhat poorly drained or moderately well drained soils that formed in alluvium derived from basalt. These soils are on mounds and in swales on strath terraces on Cascade foothills and on fan terraces. Slopes range from 0 to 5 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Durixeralfs

Reference Pedon

Durixeralfs gravelly fine sandy loam, on a slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 194 feet (59 m). When described on 5/20/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); light brown (7.5YR 6/4) gravelly fine sandy loam, brown (7.5YR 4/3) moist; 15 percent clay; moderate thin platy structure parting to moderate fine subangular blocky; hard, friable, nonsticky, slightly plastic; common very fine roots; few very fine tubular pores; 10 percent very fine irregular strong brown (7.5YR 4/6 dry) oxidized iron masses throughout; 25 percent rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—1 to 5 inches (3 to 13 cm); brown (7.5YR 5/4) gravelly fine sandy loam, brown (7.5YR 4/3) moist; 18 percent clay; moderate medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 10 percent clay films on surfaces along pores; 30 percent rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt2—5 to 10 inches (13 to 25 cm); brown (7.5YR 5/4) gravelly loam, reddish brown (5YR 4/4) moist; 24 percent clay; moderate fine subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; many very fine tubular pores; 30 percent clay films on faces of peds; 25 percent rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt3—10 to 18 inches (25 to 46 cm); light brown (7.5YR 6/4) gravelly loam, reddish brown (5YR 4/3) moist; 26 percent clay; moderate fine subangular blocky structure; hard, friable, slightly sticky, moderately plastic; few very fine roots; many very fine tubular pores; 50 percent clay films on faces of peds; 25 percent rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt4—18 to 24 inches (46 to 61 cm); light brown (7.5YR 6/4) very gravelly clay loam, reddish brown (5YR 4/3) moist; 28 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine roots; many very fine tubular pores; 60 percent clay films on faces of peds; 25 percent well rounded cobbles and 30 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

2Bt5—24 to 27 inches (61 to 69 cm); pale brown (10YR 6/3) very gravelly sandy clay, brown (10YR 5/3) moist; 45 percent clay; weak fine angular blocky structure; extremely hard, very firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; 30 percent very fine irregular black (N 2/0 dry) manganese

masses throughout; 50 percent rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

3Bqm—27 inches (69 cm); indurated duripan; few very fine roots on top of the horizon; 20 percent very fine irregular black (N 2/0 dry) manganese masses at the top of the horizon; cemented by silica; 10 percent rounded basalt cobbles and 40 percent rounded basalt gravel; discontinuous silica- and manganese-cemented capping 1/16 to 1/8 inch thick; rock fragments protruding through the top of the duripan.

The reference pedon is an example of the soils within this category. The properties represented in map units 321 and 377 vary. The particle-size classes represented by this description include fine-loamy, clayey-skeletal, and loamy-skeletal. The subgroups represented include Haplic and Typic.

Type location: Butte County, California; about 3.6 miles northwest of Oroville, approximately 3,150 feet west and 250 feet north of the southeast corner of sec. 34, T. 20 N., R. 3 E.; 39 degrees, 32 minutes, 19 seconds north latitude and 121 degrees, 37 minutes, 31 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

Depth to the duripan is 9 to 40 inches (23 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 24 to 43 percent clay and 30 to 45 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 0 to 1 percent in the A horizon and is less than 1 percent below the A horizon. A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through April. Rock fragments on the surface range from 0 to 20 percent gravel, 0 to 20 percent cobbles, and 0 to 1 percent stones. Some pedons do not have a 2Bt horizon.

The A horizon has dry color of 7.5YR 4/3, 4/4, 5/3, 5/4, or 6/4 or 10YR 4/2, 4/4, 5/3, or 6/3. Moist color is 7.5YR 3/2, 3/3, 4/2, or 4/3 or 10YR 2/2, 3/1, 3/3, 4/2, or 4/3. Texture is gravelly sandy loam, gravelly loam, fine sandy loam, loam, cobbly loam, or gravelly fine sandy loam. The content of clay ranges from 12 to 15 percent. The horizon has 2 to 30 percent gravel and 0 to 10 percent cobbles. Redoximorphic features range from 0 to 60 percent oxidized iron masses and 5 to 10 percent iron-manganese masses. Reaction ranges from strongly acid to slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 4/4, 5/3, 5/4, 6/4, 4/6, or 5/6 or 10YR 4/2, 4/4, 5/3, 5/4, 6/2, or 6/3. Moist color is 7.5YR 3/3, 4/3, 3/4, or 4/4; 10YR 3/2, 3/3, 4/2, or 4/3; or 5YR 4/3, 3/4, or 4/4. Texture is gravelly fine sandy loam, gravelly loam, gravelly clay loam, gravelly sandy clay loam, fine sandy loam, loam, sandy clay loam, very gravelly loam, cobbly loam, or clay loam. The content of clay ranges from 15 to 30 percent. The content of gravel is 5 to 45 percent, and the content of cobbles is 0 to 15 percent. Redoximorphic features range from 0 to 50 percent oxidized iron masses and 0 to 20 percent iron-manganese masses. Reaction is moderately acid or slightly acid.

The lower part of the Bt horizon has dry color of 7.5YR 4/4, 5/3, 5/4, 5/6, 6/4, 7/4, or 4/6 or 10YR 5/3, 6/3, or 6/4. Moist color is 5YR 4/3 or 3/4; 7.5YR 3/3, 4/3, 3/4, or 4/4; or 10YR 4/3 or 5/3. Texture is very gravelly clay loam, gravelly clay loam, sandy clay loam, clay loam, very cobbly clay loam, or cobbly clay loam. The content of clay ranges from 28 to 38 percent. The content of gravel is 0 to 45 percent, and the content of cobbles is 0 to 25 percent. Redoximorphic features range from 0 to 30 percent oxidized iron masses, 0 to 20 percent iron-manganese masses, and 0 to 15 percent manganese masses. Reaction is moderately acid or slightly acid.

The 2Bt horizon has dry color of 10YR 4/2, 5/2, 5/3, 6/3, or 6/4 or 7.5YR 4/3, 5/3, 5/4, 6/4, or 6/6. Moist color is 10YR 3/2, 4/2, 4/3, or 5/3 or 7.5YR 3/3, 3/4, 4/3, 4/6, or

5/3. Texture is very gravelly sandy clay, very gravelly clay, very gravelly clay loam, gravelly clay, very gravelly silty clay, extremely gravelly clay, extremely gravelly sandy clay, or cobbly clay. The content of clay ranges from 35 to 50 percent. The horizon has 5 to 60 percent gravel and 0 to 25 percent cobbles. Redoximorphic features range from 0 to 50 percent iron-manganese masses, 0 to 10 percent oxidized iron masses, and 0 to 10 percent manganese masses. Reaction is slightly acid or neutral.

The 3Bqm horizon has 25 to 80 percent gravel and 0 to 45 percent cobbles. It ranges from indurated to very weakly cemented. Redoximorphic features range from 5 to 40 percent iron-manganese masses. The horizon is as much as 10 feet thick and overlies sandstone.

Durixerolls

Durixerolls consist of moderately deep, somewhat poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are on alluvial fans. Slopes range from 0 to 2 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Durixerolls

Typical Pedon

Durixerolls clay loam, on a slope of less than 1 percent, in a disked grain field, at an elevation of 157 feet (48 m). When described on 7/8/1993, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 6 inches (0 to 15 cm); brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; 35 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common fine and many very fine roots; common fine irregular and few very fine tubular pores; 5 percent very fine oxidized iron masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Ap2—6 to 12 inches (15 to 30 cm); brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; 31 percent clay; moderate fine and medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine and common very fine roots; few very fine and fine tubular pores; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bw1—12 to 24 inches (30 to 61 cm); yellowish brown (10YR 5/4) clay loam, dark brown (10YR 3/3) moist; 31 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine and common very fine roots; few very fine and fine tubular pores; neutral, pH 7.1 by Hellige-Truog; gradual smooth boundary.

Bw2—24 to 33 inches (61 to 84 cm); brown (7.5YR 5/4) clay loam, dark brown (7.5YR 3/4) moist; 31 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine roots; few very fine and fine tubular pores; 2 percent very fine oxidized iron masses and 5 percent very fine manganese masses; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

2Bqm—33 inches (84 cm); indurated duripan; cemented by silica; 25 percent fine manganese coatings on top of the duripan.

Type location: Butte County, California; about 1.8 miles north of Nord, approximately 1,535 feet west and 1,215 feet south of the northeast corner of sec. 34, T. 23 N., R. 1 W.; 39 degrees, 48 minutes, 25 seconds north latitude and 121 degrees, 57 minutes, 40 seconds west longitude; NAD27; USGS Quad: Nord, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 130 to 150 days). The particle-size control section averages 27 to 35 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 4 percent to a depth of 12 inches (30 cm) and 0.1 to 1 percent below that depth. A fluctuating water table can occur between the top of the duripan and 12 inches (30 cm) below the surface of the soil from December through April.

The Ap horizon has dry color of 10YR 5/2 or 5/3. Moist color is 10YR 3/2 or 3/3. Texture is loam, clay loam, or silty clay loam. The content of clay ranges from 18 to 40 percent. The content of gravel is 0 to 15 percent. Redoximorphic features range from 0 to 15 percent oxidized iron masses. Reaction ranges from moderately acid to moderately alkaline.

The Bw horizon has dry color of 10YR 5/3 or 5/4 or 7.5YR 5/4 or 6/4. Moist color is 10YR 3/3 or 7.5YR 3/3 or 3/4. Texture is loam, clay loam, silty clay loam, silt loam, or sandy loam. The content of clay ranges from 17 to 35 percent. The content of gravel is 0 to 10 percent. Redoximorphic features range from 0 to 20 percent manganese masses and 0 to 10 percent oxidized iron masses. Reaction ranges from neutral to moderately alkaline.

Dystroxerepts

Dystroxerepts consist of moderately deep or deep, well drained soils that formed in colluvium derived from metavolcanic and metasedimentary rocks. These soils are on backslopes in canyons on Sierra Nevada foothills. Slopes range from 70 to 110 percent. The mean annual precipitation is about 62 inches (1,575 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, thermic Typic Dystroxerepts

Typical Pedon

Dystroxerepts, on a west-facing slope of 92 percent, under a cover of canyon live oak, Pacific poison oak, toyon, California laurel, and buckbrush, at an elevation of 1,260 feet (384 m). When described on 6/30/1998, the soil was dry to a depth of 12 inches (30 cm) and slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 4 inches (3 to 10 cm); very pale brown (10YR 7/3) extremely gravelly loam, brown (10YR 4/3) moist; 26 percent clay; moderate fine and medium subangular blocky structure parting to moderate fine granular; slightly hard, friable, moderately sticky, slightly plastic; many very fine and fine roots; many very fine to coarse irregular and tubular pores; 10 percent cobbles, 15 percent stones, and 40 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—4 to 12 inches (10 to 30 cm); very pale brown (10YR 7/4) extremely gravelly clay loam, yellowish brown (10YR 5/4) moist; 30 percent clay; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular and irregular pores; 60 percent discontinuous faint clay films; 15 percent cobbles, 15 percent stones, and 25 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; gradual smooth boundary.

Bt2—12 to 22 inches (30 to 56 cm); very pale brown (10YR 7/4) extremely gravelly clay loam, yellowish brown (10YR 5/4) moist; 28 percent clay; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common very fine to coarse roots; many very fine to coarse tubular and irregular pores; 60 percent discontinuous faint clay films; 20 percent cobbles and 40 percent gravel; very strongly acid, pH 5.1 by Hellige-Truog; gradual smooth boundary.

Bt3—22 to 28 inches (56 to 71 cm); very pale brown (10YR 7/4) extremely gravelly loam, yellowish brown (10YR 5/4) moist; 27 percent clay; weak fine subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common very fine to medium roots; many very fine and fine tubular and irregular pores; 60 percent discontinuous faint clay films; 30 percent cobbles and 40 percent gravel; strongly acid, pH 5.6 by Hellige-Truog; clear smooth boundary.

Bt4—28 to 38 inches (71 to 97 cm); very pale brown (10YR 7/4) extremely cobbly sandy clay loam, yellowish brown (10YR 5/4) moist; 27 percent clay; weak fine subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; few very fine to coarse roots; many very fine to medium tubular and irregular pores; 60 percent discontinuous faint clay films; 40 percent gravel and 45 percent cobbles; moderately acid, pH 5.8 by Hellige-Truog; clear wavy boundary.

R—38 inches (97 cm); indurated metavolcanic bedrock.

Type location: Butte County, California; about 1.1 miles south of Bear Lake, approximately 200 feet south and 2,000 feet east of the northwest corner of sec. 31, T. 24 N., R. 3 E.; 39 degrees, 54 minutes, 10 seconds north latitude and 121 degrees, 41 minutes, 15 seconds west longitude; NAD83; USGS Quad: Cohasset, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 60 inches (51 to 152 cm). The mean annual soil temperature is 59 to 69 degrees F (15 to 21 degrees C). The soil moisture control section is dry in all parts from about June to November (about 150 days). The particle-size control section averages 17 to 30 percent clay and 50 to 80 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 10 to 50 percent gravel, 10 to 30 percent cobbles, 10 to 30 percent stones, and 0 to 30 percent boulders.

The A horizon has dry color of 10YR 6/3, 6/4, 7/3, or 7/4. Moist color is 10YR 4/2 or 4/3. Texture is very gravelly loam, extremely gravelly loam, very gravelly fine sandy loam, or extremely gravelly fine sandy loam. The content of clay ranges from 12 to 27 percent. The horizon has 30 to 40 percent gravel, 5 to 15 percent cobbles, 5 to 15 percent stones, and 0 to 10 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 6/3, 6/4, or 7/4. Moist color is 10YR 4/2, 4/3, 4/4, or 5/4. Texture is extremely gravelly fine sandy loam, extremely gravelly loam, very cobbly fine sandy loam, extremely cobbly fine sandy loam, extremely cobbly sandy clay loam, or extremely gravelly clay loam. The content of clay ranges from 10 to 30 percent. The horizon has 15 to 50 percent gravel, 15 to 50 percent cobbles, 0 to 25 percent stones, and 0 to 5 percent boulders. Reaction ranges from strongly acid to neutral.

Earlal Series

The Earlal series consists of shallow, well drained soils that formed in residuum and colluvium derived from serpentinized ultramafic rocks. These soils are on ridgetops and side slopes on ultramafic Sierra Nevada mountains. Slopes range from 3 to 80 percent. The mean annual precipitation is about 52 inches (1,321 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Loamy-skeletal, magnesic, mesic Lithic Haploxeralfs

Typical Pedon

Earlal very gravelly loam, on a south-facing slope of 20 percent, under a cover of foothill pine, whiteleaf manzanita, blue oak, buckbrush, and canyon live oak, at an elevation of 2,305 feet (703 m). When described on 10/19/2000, the soil was dry to a depth of 3 inches (8 cm) and very slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (7.5YR 5/3) very gravelly loam, dark brown (7.5YR 3/2) moist; 25 percent clay; moderate fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and few medium roots; many very fine to medium irregular and tubular pores; 10 percent cobbles and 25 percent gravel; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bt1—3 to 7 inches (8 to 18 cm); brown (7.5YR 5/3) very gravelly clay loam, brown (7.5YR 4/2) moist; 34 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium roots; many very fine to medium tubular pores; 60 percent continuous distinct clay films; 20 percent cobbles and 25 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt2—7 to 14 inches (18 to 36 cm); brown (7.5YR 5/4) extremely gravelly clay loam, dark brown (7.5YR 3/3) moist; 37 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium and common coarse roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 35 percent cobbles and 40 percent gravel; neutral, pH 7.0 by Hellige-Truog; abrupt wavy boundary.

R—14 inches (36 cm); indurated serpentinite bedrock.

Type location: Butte County, California; about 1.12 miles east of Concow School, approximately 1,250 feet north and 550 feet west of the southeast corner of sec. 27, T. 22 N., R. 4 E.; 39 degrees 43 minutes, 47 seconds north latitude and 121 degrees, 30 minutes, 26 seconds west longitude; NAD83; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 57 to 59 degrees F (14 to 15 degrees C). The particle-size control section averages 27 to 35 percent clay and 50 to 70 percent rock fragments, mostly gravel and cobbles. Mineralogy is magnesic. Rock fragments on the surface range from 20 to 50 percent gravel, 20 to 30 percent cobbles, 10 to 20 percent stones, and 5 to 15 percent boulders.

The A horizon has dry color of 7.5YR 5/3, 6/3, or 6/4 or 10YR 6/4. Moist color is 7.5YR 3/2, 3/3, or 3/4 or 10YR 4/3. Texture is very gravelly loam, extremely gravelly loam, very cobbly loam, or very stony loam. The content of clay ranges from 18 to 27 percent. The horizon has 20 to 50 percent gravel, 10 to 25 percent cobbles, 0 to 10 percent stones, and to 0 to 10 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 5YR 5/3, 5/4, or 6/4; 7.5YR 6/4; or 10YR 7/4. Moist color is 5YR 3/3 or 4/2; 7.5YR 3/4, 4/3, 4/4, or 4/6; or 10YR 4/3, 4/4, or 5/4. Texture is very gravelly clay loam, extremely gravelly clay loam, very cobbly clay loam, extremely cobbly clay loam, or very gravelly loam. The content of clay ranges from 24 to 40 percent. The horizon has 20 to 40 percent gravel, 20 to 40 percent cobbles, 0 to 10 percent stones, and to 0 to 10 percent boulders. Reaction is slightly acid or neutral.

Eastbiggs Series

The Eastbiggs series consists of moderately deep, somewhat poorly drained soils that formed in alluvium derived from igneous and metamorphic rocks. These soils are on mounds on low terraces. Slopes range from 0 to 3 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, active, thermic Abruptic Durixeralfs

Typical Pedon

Eastbiggs loam, on a west-facing slope of 2 percent, under a cover of annual grasses and forbs, at an elevation of 90 feet (27 m). When described on 5/11/1992, the soil was dry to a depth of 4 inches (10 cm) and slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); strong brown (7.5YR 4/6) loam, dark brown (7.5YR 3/4) moist; 23 percent clay; weak fine subangular blocky structure; hard, friable, slightly sticky, slightly plastic; many very fine roots; few fine and many very fine tubular pores; 10 percent fine black (N 2/0 moist) iron-manganese nodules; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

A2—3 to 10 inches (8 to 25 cm); strong brown (7.5YR 4/6) loam, dark brown (7.5YR 3/4) moist; 23 percent clay; weak fine subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; few fine and many very fine tubular pores; 10 percent fine black (N 2/0 moist) manganese masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

BAt—10 to 17 inches (25 to 43 cm); strong brown (7.5YR 4/6) loam, dark brown (7.5YR 3/4) moist; 26 percent clay; weak fine subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; few fine and many very fine tubular pores; 10 percent fine black (N 2/0 moist) iron-manganese nodules and 15 percent fine black (N 2/0 moist) manganese masses; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

2Bt—17 to 27 inches (43 to 69 cm); brown (7.5YR 5/4) clay, brown (7.5YR 4/4) moist; 50 percent clay; strong coarse prismatic structure; very hard, firm, very sticky, very plastic; common very fine roots; common very fine tubular pores; 2 percent pressure faces; 10 percent fine black (N 2/0 moist) iron-manganese nodules and 15 percent fine black (N 2/0 moist) manganese masses; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

3Bqm1—27 to 34 inches (69 to 86 cm); duripan with indurated laminar capping 1/4 to 1/2 inch (6 to 12 mm) thick; strong thin platy structure; very rigid, indurated, cemented by silica; roots matted on top of the capping; black (N 2/0 moist) manganese coatings, 1/8 inch (3 mm) thick, on top of the laminar capping; abrupt smooth boundary.

3Bqm2—34 to 60 inches (86 to 152 cm); duripan; rigid, strongly cemented by silica.

Type location: Butte County, California; about 1.4 miles west of Honcut, approximately 1,450 feet west and 1,500 feet south of the northeast corner of sec. 18, T. 17 N., R. 4 E.; 39 degrees, 19 minutes, 55 seconds north latitude and 121 degrees, 33 minutes, 43 seconds west longitude; NAD27; USGS Quad: Honcut, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry from June to November (170 to 190 days). The particle-size control section averages 35 to 50 percent clay. There is an abrupt boundary at the top of the argillic horizon with an absolute clay increase of at least 15 percent. Mineralogy is

mixed. Redoximorphic features, such as manganese nodules, manganese masses with color of N 2/0 moist, and oxidized iron masses with color of 7.5YR 4/6 or 5/6 moist, occur at a depth of 3 to 34 inches (8 to 86 cm). A fluctuating water table can occur between the top of the duripan and 14 inches (36 cm) below the surface of the soil from December through April. Some pedons have lime in the 2Bt horizon.

The A horizon has dry color of 7.5YR 4/4, 4/6, 5/4, or 6/2 or 10YR 5/4, 6/2, 6/3, or 6/4. Moist color is 7.5YR 3/4 or 4/4 or 10YR 3/2, 3/3, or 3/4. Texture is loam or fine sandy loam. The content of clay ranges from 15 to 27 percent. The content of organic matter is 0.2 to 1 percent. Reaction ranges from moderately acid to neutral.

The BAt, Bt, or Btb horizon has dry color of 7.5YR 4/6, 5/3, or 6/3 or 10YR 5/4. Moist color is 7.5YR 3/4, 4/3, or 5/3; 10YR 4/3; or 5YR 4/4. Texture is loam, clay loam, or sandy clay loam. The content of clay ranges from 20 to 35 percent. The content of organic matter is 0.1 to 0.5 percent. Reaction is slightly acid or neutral.

The 2Bt horizon has dry color of 7.5YR 4/4, 5/4, 5/6, or 6/4. Moist color is 7.5YR 4/3 or 4/4 or 5YR 4/6. Texture is clay. The content of clay ranges from 40 to 50 percent. The content of organic matter is 0.1 to 0.3 percent. Reaction is neutral.

Edjobe Series

The Edjobe series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are on basin rims. Slopes are 0 to 1 percent. The mean annual precipitation is about 21 inches (533 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Epiaquerts

Typical Pedon

Edjobe silty clay, on a slope of less than 1 percent, under a cover of weeds in a fallow field, at an elevation of 122 feet (37 m). When described on 7/15/1993, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted).

Ap—0 to 8 inches (0 to 20 cm); very dark gray (10YR 3/1) silty clay, black (10YR 2/1) moist; 55 percent clay; strong medium angular blocky structure parting to strong fine granular; extremely hard, firm, very sticky, very plastic; common fine roots; common fine irregular pores; slightly alkaline, pH 7.5 pH by Hellige-Truog; abrupt smooth boundary.

Bssg—8 to 25 inches (20 to 64 cm); dark gray (10YR 4/1) silty clay, very dark gray (10YR 3/1) moist; 55 percent clay; strong very coarse prismatic structure parting to strong medium angular blocky; extremely hard, firm, very sticky, very plastic; few very fine and fine roots; few very fine tubular pores; many slickensides; slightly alkaline, pH 7.5 pH by Hellige-Truog; clear wavy boundary.

Bkssg—25 to 32 inches (64 to 81 cm); dark gray (10YR 4/1) silty clay, very dark gray (10YR 3/1) moist; 42 percent clay; strong medium angular blocky structure; extremely hard, firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; many slickensides; few fine round carbonate concretions; common fine spherical and irregular soft masses of carbonate throughout; moderately alkaline, pH 8.0 pH by Hellige-Truog; gradual wavy boundary.

Bw1—32 to 48 inches (81 to 122 cm); dark gray (10YR 4/1) silty clay loam, dark grayish brown (10YR 4/2) moist; 37 percent clay; moderate fine and medium angular blocky structure; very hard, firm, sticky, plastic; few very fine roots; common very fine and few medium tubular pores; slightly effervescent throughout; moderately alkaline, pH 8.0 pH by Hellige-Truog; gradual smooth boundary.

2Bw2—48 to 60 inches (122 to 152 cm); light brownish gray (10YR 6/2) clay loam, grayish brown (10YR 5/2) moist; 30 percent clay; weak fine and medium angular

blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine roots; common very fine and fine and few medium tubular pores; many fine faint brown (10YR 4/3 moist) irregular soft oxidized iron masses throughout and few fine patchy prominent black (N 2/0 moist) manganese masses on faces of peds; slightly effervescent; moderately alkaline, pH 8.0 pH by Hellige-Truog; gradual smooth boundary.

2Bq—60 to 69 inches (152 to 175 cm); pale brown (10YR 6/3) clay loam, brown (10YR 5/3) moist; 28 percent clay; massive; hard, firm, slightly sticky, slightly plastic; few very fine roots; common fine and very fine and few medium tubular pores; many fine distinct brown (7.5YR 4/4 moist) irregular soft oxidized iron masses throughout; 5 percent weakly cemented durinodes; slightly effervescent throughout; moderately alkaline, pH 8.0 pH by Hellige-Truog; abrupt smooth boundary.

2Bkqm—69 to 75 inches (175 to 190 cm); pale brown (10YR 6/3), moderately cemented duripan, brown (7.5YR 4/4) moist; indurated capping with continuous silica cementation; weak thin platy structure; very rigid, nonsticky, nonplastic; common fine and medium carbonate threads; moderately alkaline, pH 8.0 pH by Hellige-Truog.

Type location: Butte County, California; about 3 miles south of Durham, approximately 5,050 feet west and 4,950 feet south of the intersection of Grainland Road and Durham Nelson Road; in an unsectionized area in the Aquas Frias Land Grant; 39 degrees, 35 minutes, 48 seconds north latitude and 121 degrees, 49 minutes, 2 seconds west longitude; NAD27; USGS Quad: Nelson, California.

Range in Characteristics

Depth to the duripan is 60 to 80 inches (152 to 203 cm). The mean annual soil temperature is 60 to 62 degrees F (16 to 17 degrees C). The soil moisture control section is dry from July to November (120 to 125 days). The particle-size control section averages 40 to 50 percent clay. Mineralogy is smectitic. The soils are calcareous at a depth of 25 to 72 inches (64 to 183 cm). Surface-initiated, reversible cracks 1 to 2 inches (2.54 to 5 cm) wide extend to a depth of 31 inches (79 cm) from about May 15 to October 15 (140 to 160 days) when the soils are not irrigated. Common or many intersecting slickensides occur in the Bssg and Bkssg horizons, from 8 to 50 inches (20 to 127 cm). A fluctuating water table can occur between the top of the duripan and 10 inches (25 cm) below the surface of the soil from December through May. Redoximorphic features, such as a reduced matrix, occur in the overlying basin material, and oxidized iron masses and manganese masses occur in the underlying loamy material. Some pedons do not have gleyed matrix colors. In some pedons, oxidized iron masses, manganese masses, and/or iron-manganese concretions occur in the overlying basin material and iron-manganese concretions occur in the underlying loamy material. Some pedons do not have accumulations of calcium carbonate.

The Ap horizon has dry color of 10YR 3/1, 4/1, 4/2, 5/1, or 5/2. Moist color is 10YR 2/1, 3/1, or 3/2. The content of clay ranges from 40 to 55 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bssg horizon has dry color of 10YR 4/1, 5/1, 5/2, or 4/2. Moist color is 10YR 3/1, 4/1, or 4/2. Texture is silty clay or clay. The content of clay ranges from 40 to 55 percent. Reaction ranges from neutral to moderately alkaline.

The Bkssg horizon has dry color of 10YR 4/1, 5/1, 5/2, or 4/2. Moist color is 10YR 3/1, 4/1, or 4/2. Texture is silty clay or clay. The content of clay ranges from 40 to 50 percent. Reaction is slightly alkaline or moderately alkaline.

The Bw horizon has dry color of 10YR 4/1, 5/1, 5/2, or 4/2. Moist color is 10YR 3/1, 4/1, or 4/2. Texture is silty clay loam or clay loam. The content of clay ranges from 27 to 40 percent. Reaction is slightly alkaline or moderately alkaline.

The 2Bw horizon has dry color of 10YR 6/2 or 4/2. Moist color is 10YR 5/2 or 4/2. Texture is clay loam or loam. The content of clay ranges from 25 to 40 percent. Redoximorphic features, such as oxidized iron masses (10YR 4/4 or 7.5YR 3/4, 4/4, or 4/6 moist), manganese masses (N 2/0 moist), and/or iron-manganese concretions (N 2/0 moist), occur on faces of peds, in pores, and throughout the horizon. Reaction is slightly alkaline or moderately alkaline.

The 2Bq horizon has dry color of 10YR 6/3 or 5/3. Moist color is 10YR 4/3 or 5/3. Texture is clay loam or loam. The content of clay ranges from 25 to 35 percent. Redoximorphic features, such as oxidized iron masses (10YR 4/4 or 7.5YR 3/4, 4/4, or 4/6 moist), manganese masses (N 2/0 moist), and/or iron-manganese concretions (N 2/0 moist), occur on faces of peds, in pores, and throughout the horizon. Rupture resistance ranges from weakly cemented to moderately cemented. Reaction is slightly alkaline or moderately alkaline.

The 2Bkqm horizon has dry color of 10YR 6/3 or 6/4. Moist color is 10YR 4/3 or 4/4 or 7.5YR 4/4. Rupture resistance ranges from indurated to strongly cemented. The horizon has alternating layers that are weakly cemented and moderately cemented with silica and carbonates. Reaction is moderately alkaline.

Elsey Series

The Elsey series consists of moderately deep, somewhat poorly drained soils that formed in residuum weathered from basalt. These soils are on mounds on the top of basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Oxyaquic Haplohumults

Typical Pedon

Elsey loam, on a north-facing slope of 3 percent, under a cover of annual grasses, at an elevation of 1,330 feet (405 m). When described on 10/18/2000, the soil was moist from 0 to 17 inches (0 to 43 cm) and dry below 17 inches. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (10YR 5/3) loam, dark brown (7.5YR 3/2) moist; 16 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many fine roots throughout; many fine irregular pores; 10 percent subangular basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

BAt—3 to 8 inches (8 to 20 cm); brown (10YR 5/3) gravelly loam, dark brown (7.5YR 3/2) moist; 18 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many fine roots throughout; many fine irregular pores; 5 percent patchy faint clay films on surfaces along pores; 15 percent subangular basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt1—8 to 17 inches (20 to 43 cm); brown (10YR 4/3) cobbly loam, dark brown (7.5YR 3/2) moist; 24 percent clay; moderate medium subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; many fine roots throughout and common medium roots between peds; common fine irregular and tubular pores; 10 percent discontinuous faint clay films on surfaces along pores; 10 percent subangular basalt gravel and 20 percent subangular basalt cobbles; moderately acid, pH 5.8 by Hellige-Truog; clear smooth boundary.

Bt2—17 to 25 inches (43 to 64 cm); brown (10YR 4/3) cobbly loam, dark brown (7.5YR 3/2) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common fine and

few medium roots between peds; common fine irregular and tubular pores; 15 percent discontinuous faint clay films on surfaces along pores; 10 percent subangular basalt gravel and 20 percent subangular basalt cobbles; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

Bt3—25 to 32 inches (64 to 81 cm); brown (10YR 4/3) very cobbly clay loam, dark brown (7.5YR 3/2) moist; 26 percent clay; moderate medium and fine subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common fine and few very fine roots between peds; few fine tubular pores; 20 percent discontinuous faint clay films on surfaces along pores; 10 percent subangular basalt gravel and 30 percent basalt cobbles; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

Bt4—32 to 38 inches (81 to 97 cm); brown (10YR 4/3) very cobbly loam, dark brown (7.5YR 3/2) moist; 25 percent clay; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common fine roots between peds; few fine tubular pores; 20 percent discontinuous faint clay films on surfaces along pores; 15 percent subangular basalt gravel and 40 percent basalt cobbles; moderately acid, pH 6.0 by Hellige-Truog; abrupt wavy boundary.

R—38 inches (97 cm); indurated basalt bedrock.

Type location: Butte County, California; about 5 miles north of Oroville, approximately 1,200 feet south and 750 feet west of the northeast corner of sec. 17, T. 20 N., R. 4 E.; 39 degrees, 35 minutes, 41.1 seconds north latitude and 121 degrees, 32 minutes, 31.9 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to lithic basalt bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about May to November (about 150 to 200 days). The particle-size control section averages 24 to 27 percent clay and 15 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. By sum of cations, base saturation ranges from 1.6 to 7 percent. A fluctuating water table can occur between the top of the bedrock and 15 inches (38 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 5 to 15 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 4/4 or 10YR 3/4, 4/3, 4/4, or 5/3. Moist color is 7.5YR 2/2, 3/2, or 3/3; 10YR 2/2, 3/2, or 3/3; or 5YR 2/2. Texture is loam or gravelly loam. The content of clay ranges from 15 to 22 percent. The horizon has 5 to 15 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 4 to 8 percent. Reaction is strongly acid or moderately acid.

The BAt horizon has dry color of 7.5YR 3/4 or 4/4 or 10YR 3/4, 4/4, or 5/3. Moist color is 7.5YR 3/2 or 3/3, 10YR 3/2 or 3/3, or 5YR 3/2. Texture is loam or gravelly loam. The content of clay ranges from 18 to 24 percent. The horizon has 5 to 20 percent gravel and 0 to 10 percent cobbles. The content of organic matter is 3 to 6 percent. Reaction is strongly acid or moderately acid.

The Bt1 and Bt2 horizons have dry color of 7.5YR 4/3 or 4/4 or 10YR 3/4, 4/3, 4/4, 5/3, or 5/4. Moist color is 7.5YR 3/2 or 3/3, 10YR 3/2 or 3/3, or 5YR 3/2. Texture is loam, gravelly loam, or cobbly loam. The content of clay ranges from 19 to 27 percent. The horizons have 5 to 20 percent gravel and 5 to 20 percent cobbles. The content of organic matter is 1 to 3 percent. Reaction is strongly acid or moderately acid.

The Bt3 and Bt4 horizons have dry color of 7.5YR 4/3 or 4/4 or 10YR 3/4, 4/3, or 4/4. Moist color is 7.5YR 3/2, 3/3, or 4/3; 10YR 3/2, 3/3, or 3/4; or 5YR 3/3. Texture is cobbly loam, cobbly clay loam, very cobbly loam, very cobbly clay loam, gravelly loam, gravelly clay loam, or very gravelly clay loam. The content of clay ranges from 25 to 33 percent. The horizons have 5 to 25 percent gravel and 10 to 40 percent

cobbles. The content of organic matter is 0.2 to 1 percent. Reaction is strongly acid or moderately acid.

Endoaquolls

Endoaquolls consist of very deep, poorly drained soils that formed in alluvium derived from volcanic and metamorphic rocks. These soils are in meadows in Sierra Nevada and Cascade mountain valleys. Slopes range from 0 to 8 percent. The mean annual precipitation is about 70 inches (1,778 mm), and the mean annual air temperature is about 50 degrees F (10 degrees C).

Taxonomic class: Endoaquolls

Typical Pedon

Endoaquolls, on a west-facing slope of 3 percent, under a cover of sedges, rushes, forbs, and grasses, at an elevation of 4,236 feet (1,291 m). When described on 11/5/2003, the soil was moist to a depth of 3 inches (8 cm), dry from 3 to 28 inches (8 to 71 cm), and wet below 28 inches (71 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); dark grayish brown (10YR 4/2) loam, black (10YR 2/1) moist; 25 percent clay; moderate fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular pores; NaF pH 9.0; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

A2—3 to 8 inches (8 to 20 cm); dark grayish brown (10YR 4/2) loam, black (10YR 2/1) moist; 27 percent clay; strong fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine to medium roots; many very fine and fine irregular pores; NaF pH 9.0; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

A3—8 to 17 inches (20 to 43 cm); dark grayish brown (10YR 4/2) clay loam, black (10YR 2/1) moist; 29 percent clay; strong fine to coarse subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium roots; many very fine and fine irregular pores; NaF pH 9.0; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bw—17 to 28 inches (43 to 71 cm); grayish brown (10YR 5/2) silty clay, very dark grayish brown (10YR 3/2) moist; 40 percent clay; moderate coarse prismatic structure parting to strong medium and coarse angular blocky; very hard, friable, very sticky, very plastic; common very fine to medium roots; many very fine to medium irregular and tubular pores; NaF pH 9.0; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Ab—28 to 43 inches (71 to 109 cm); dark grayish brown (10YR 4/2) silty clay, black (10YR 2/1) moist; 43 percent clay; moderate medium and coarse subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine to medium roots; many very fine and fine irregular and common very fine tubular pores; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

2Bg1—43 to 58 inches (109 to 147 cm); light gray (10YR 7/2) loam, dark grayish brown (10YR 4/2) moist; 24 percent clay; weak medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine and fine irregular and tubular pores; 10 percent medium prominent irregular oxidized iron masses that have sharp boundaries and are on surfaces along root channels; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

2Bg2—58 to 73 inches (147 to 185 cm); light gray (2.5Y 7/2) sandy clay loam, dark grayish brown (2.5Y 4/2) moist; 23 percent clay; weak medium subangular blocky

structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine tubular and irregular pores; neutral, pH 6.8 by Hellige-Truog.

Type location: Butte County, California; about 1 mile north of Butte Meadows, approximately 2,600 feet east and 1,500 feet south of the northwest corner of sec. 20, T. 26 N., R. 4 E.; 40 degrees, 5 minutes, 47 seconds north latitude and 121 degrees, 32 minutes, 49 seconds west longitude; NAD27; USGS Quad: Butte Meadows, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 47 to 50 degrees F (8 to 10 degrees C). The soil moisture control section is dry in all parts from about July to October (about 120 days). The particle-size control section averages 30 to 45 percent clay and 0 to 10 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur from the surface of the soil to a depth of 43 inches (109 cm) from December through June and from a depth of 17 to 87 inches (43 to 220 cm) from July through November. Redoximorphic features, such as low chromas, occur in all horizons. Redoximorphic concentrations are in the lower part of the profile.

The A horizon has dry color of 10YR 4/2 or 2.5Y 5/2 or 6/1. Moist color is 10YR 2/1 or 3/2 or 2.5Y 3/1. Texture is loam, clay loam, silt loam, or fine sandy loam. The content of clay ranges from 16 to 30 percent. The content of gravel is 0 to 5 percent. Reaction is slightly acid or neutral.

The Bw horizon has dry color of 10YR 5/2 or 4/2. Moist color is 10YR 3/2 or 3/1. Texture is clay loam or silty clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 0 to 5 percent. Reaction is neutral.

The Ab horizon has dry color of 10YR 4/2 or 5/2. Moist color is 10YR 2/1 or 3/1. Texture is clay loam or silty clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 0 to 5 percent. Reaction is neutral.

The 2Bg horizon has dry color of 10YR 7/2, 2.5Y 7/2, or 2.5Y 5/1 or 6/1. Moist color is 10YR 4/2 or 2.5Y 4/1 or 4/2. Texture is loam, sandy clay loam, silty clay, or clay loam. The content of clay ranges from 20 to 50 percent. The horizon has 0 to 10 percent gravel and 0 to 10 percent cobbles. Reaction ranges from slightly acid to slightly alkaline.

Esquon Series

The Esquon series consists of deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Epiaquerts

Typical Pedon

Esquon clay, on a slope of less than 1 percent, under a cover of rice, at an elevation of 107 feet (33 m). When described on 5/3/1995, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); dark grayish brown (10YR 4/2) clay, dark gray (10YR 4/1) moist; 47 percent clay; moderate medium subangular blocky structure parting to weak fine granular; extremely hard, firm, very sticky, very plastic; common very fine and fine roots; many fine irregular pores; common fine irregular brown (7.5YR

4/4 moist) oxidized iron masses; noneffervescent; very strongly acid, pH 4.5 by pH meter 1:1 water; abrupt smooth boundary.

Bssg—5 to 11 inches (13 to 28 cm); dark grayish brown (10YR 4/2) clay, dark gray (10YR 4/1) moist; 45 percent clay; moderate medium prismatic structure parting to weak fine angular blocky; extremely hard, firm, very sticky, very plastic; few very fine and fine roots; few very fine tubular pores; few slickensides; many fine irregular dark brown (7.5YR 3/4 moist) oxidized iron masses, common fine irregular black (2/0 moist) manganese masses, and common fine spherical black (N 2/0 moist) iron-manganese concretions; noneffervescent; slightly acid, pH 6.2 by pH meter 1:1 water; abrupt smooth boundary.

Bss1—11 to 22 inches (28 to 56 cm); dark grayish brown (10YR 4/2) clay, dark grayish brown (10YR 4/2) moist; 44 percent clay; moderate coarse prismatic structure parting to moderate fine angular blocky; extremely hard, firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; few slickensides; common fine irregular dark gray (10YR 4/1 moist) iron depletions, many fine irregular brown (10YR 4/3 moist) oxidized iron masses, common fine irregular brown (7.5YR 4/4 moist) oxidized iron masses, and common fine spherical black (N 2/0 moist) manganese masses; noneffervescent; 1 percent subrounded gravel; neutral, pH 7.3 by pH meter 1:1 water; gradual smooth boundary.

Bss2—22 to 35 inches (56 to 89 cm); brown (10YR 4/3) clay, dark grayish brown (10YR 4/2) moist; 44 percent clay; moderate medium prismatic structure parting to weak fine angular blocky; extremely hard, very firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; few slickensides; common fine threadlike dark gray (10YR 4/1 moist) iron depletions and few fine spherical black (N 2/0 moist) iron-manganese nodules; noneffervescent; 1 percent subrounded gravel; slightly alkaline, pH 7.5 by pH meter 1:1 water; gradual smooth boundary.

Bkss1—35 to 46 inches (89 to 117 cm); brown (10YR 5/3) clay, brown (10YR 4/3) moist; 41 percent clay; weak fine prismatic structure parting to weak fine angular blocky; very hard, firm, very sticky, very plastic; common very fine tubular pores; few slickensides; common fine threadlike gray (10YR 5/1 moist) iron depletions; finely disseminated carbonates; slightly effervescent; 1 percent subrounded gravel; slightly alkaline, pH 7.7 by pH meter 1:1 water; clear smooth boundary.

Bkss2—46 to 50 inches (117 to 127 cm); brown (10YR 5/3) silty clay, brown (10YR 4/3) moist; 42 percent clay; weak fine angular blocky structure; very hard, firm, very sticky, very plastic; common very fine and few fine tubular pores; few slickensides; few fine spherical black (N 2/0 moist) iron-manganese concretions; finely disseminated carbonates; slightly effervescent; slightly alkaline, pH 7.7 by pH meter 1:1 water; abrupt smooth boundary.

Bk—50 to 56 inches (127 to 142 cm); light yellowish brown (10YR 6/4) clay loam, brown (10YR 4/3) moist; 25 percent clay; weak fine subangular blocky structure; rigid, moderately sticky, moderately plastic; common very fine tubular pores; few fine spherical black (N 2/0 moist) iron-manganese concretions; common fine threadlike carbonate masses; slightly effervescent; slightly alkaline, pH 7.7 by pH meter 1:1 water; abrupt smooth boundary.

2Bkqm—56 to 67 inches (142 to 170 cm); moderately cemented duripan; very pale brown (10YR 7/4) loam, brown (10YR 4/3) moist; 18 percent clay; massive; rigid, nonsticky, slightly plastic; common very fine tubular pores; common fine threadlike carbonate masses; strongly effervescent; 5 percent subrounded gravel; moderately alkaline, pH 8.1 by pH meter 1:1 water; $^{1}/_{32}$-inch (1-mm) platy silica capping on the duripan.

Type location: Butte County, California; about 1.4 miles east of Richvale, approximately 2,150 feet east and 100 feet south of the northwest corner of sec. 23,

T. 19 N., R. 2 E.; 39 degrees, 29 minutes, 36 seconds north latitude and 121 degrees, 43 minutes, 4 seconds west longitude; NAD27; USGS Quad: Biggs, California.

Range in Characteristics

Depth to the duripan is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The soil moisture control section is dry from June to October (120 to 125 days). The particle-size control section averages 50 to 55 percent clay. By ammonium acetate, base saturation ranges from 90 to 100 percent throughout the profile. Reversible, surface-initiated cracks 1 to 2 inches (2.54 to 5 cm) wide extend to a depth of 30 to 35 inches (76 to 89 cm) from May 15 to October 15 (150 days) when the soils are not irrigated. The depth to calcium carbonate ranges from 20 to 60 inches (51 to 152 cm). Effervescence ranges from none to strong. Electrical conductivity is less than 1 mmho/cm throughout the profile. Common or many slickensides are in the Bssg, Bss, and Bkss horizons, at a depth of 5 to 50 inches (13 to 127 cm). A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through May. In some areas it can occur between the top of the duripan and the surface of the soil from November through June and from the top of the duripan to a depth of 36 inches (91 cm) from July through October. Redoximorphic features, such as manganese nodules, oxidized iron masses with color of 7.5YR 4/6 moist, manganese masses with color of N 2/0 moist, iron depletions with color of 10YR 4/1 or 5/1 moist, and a reduced matrix with chroma of 2 or less, occur in the horizons above the duripan. Some pedons have overwash of silt loam, silty clay loam, or stratified very fine sandy loam to silt loam. The overwash ranges from 6 to 12 inches (15 to 51 cm) in thickness and has a clay content of 12 to 40 percent.

The Ap or Ab horizon has dry color of 10YR 3/1, 4/1, 4/2, 5/1, or 5/2. Moist color is 10YR 3/1 or 3/2. Texture is clay or silty clay. The content of clay ranges from 40 to 60 percent. The content of organic matter is 1 to 2.5 percent. Reaction ranges from very strongly acid to neutral.

The Bssg and Bss horizons have dry color of 10YR 4/1, 4/2, or 5/2. Moist color is 10YR 3/1 or 3/2. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 2 percent. The content of organic matter is 0.4 to 1 percent. Reaction ranges from slightly acid to moderately alkaline.

The Bkss horizon has dry color of 10YR 5/3 or 6/3. Moist color is 10YR 3/3 or 4/3. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 2 percent. The content of organic matter is 0.1 to 0.5 percent. Reaction ranges from neutral to moderately alkaline.

The Bk horizon has dry color of 10YR 5/3 or 4/3. Moist color is 10YR 3/3 or 4/3. Texture is silty clay, clay loam, or silty clay loam. The content of clay ranges from 25 to 60 percent. The content of organic matter is 0.1 to 0.5 percent. Reaction is slightly alkaline or moderately alkaline.

The 2Bkqm horizon has dry color of 10YR 5/3 or 4/3. Moist color is 10YR 4/3. Rupture resistance ranges from indurated to strongly cemented. The horizon has alternating layers that are weakly cemented and moderately cemented with silica and lime. Reaction is moderately alkaline.

Fallager Series

The Fallager series consists of very shallow, poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in swales on strath terraces on Cascade foothills and on fan terraces in the Sacramento Valley. Slopes range from 0 to 3 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Clayey, mixed, superactive, thermic, shallow Typic Durixeralfs

Typical Pedon

Fallager loam, on a south-facing slope of 1 percent, under a cover of goldfields, navarretia, ryegrass, brodiaea, Mediterranean barley, cowbag clover, popcorn flowers, and tarweed, at an elevation of 237 feet (72 m). When described on 3/27/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); light reddish brown (5YR 6/3) loam, reddish brown (5YR 4/3) moist; 25 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 40 percent medium irregular oxidized iron masses along faces of peds; 5 percent cobbles and 5 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—1 to 3 inches (3 to 8 cm); reddish yellow (5YR 6/6) gravelly clay loam, reddish brown (5YR 4/3) moist; 35 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine tubular pores; 60 percent continuous distinct clay films; 15 percent fine spherical manganese masses throughout; 10 percent cobbles and 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

2Bt2—3 to 7 inches (8 to 18 cm); reddish brown (5YR 5/3) gravelly clay, reddish brown (5YR 4/3) moist; 43 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine roots; common very fine and fine tubular pores; 80 percent continuous distinct clay films; 15 percent fine irregular manganese masses throughout; 10 percent cobbles and 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; abrupt smooth boundary.

3Bqm—7 inches (18 cm); very strongly cemented duripan; cemented by silica; 10 percent medium platy manganese masses at the top of the horizon; 20 percent cobbles and 60 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 1.1 miles east of the intersection of Highway 99 and Highway 149, approximately 1,350 feet south and 600 feet west of the northeast corner of sec. 6, T. 20 N., R. 3 E.; 39 degrees, 37 minutes, 18 seconds north latitude and 121 degrees, 40 minutes, 18 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

Depth to the duripan is 4 to 10 inches (10 to 25 cm). The duripan is underlain by volcanic sediments or volcanic sandstone and tuff. The mean annual soil temperature is 62 to 65 degrees F (17 to 18 degrees C). The particle-size control section averages 35 to 40 percent clay and 10 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and the surface of the soil from November through March. Redoximorphic features occur as oxidized iron and iron-manganese masses in the A, Bt, and 2Bt horizons and as an iron-manganese capping 1 to 3 mm thick on top of the 3Bqm horizon. Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 25 percent cobbles.

The A horizon has dry color of 7.5YR 5/3, 6/4, or 6/6 or 5YR 6/3. Moist color is 7.5YR 4/3 or 5/4 or 5YR 4/3. Texture is loam, gravelly loam, cobbly loam, cobbly clay loam, or gravelly silty clay loam. The content of clay ranges from 20 to 30 percent. The horizon has 5 to 15 percent gravel and 0 to 10 percent cobbles. Reaction is slightly acid.

The Bt horizon has dry color of 7.5YR 5/3, 5/4, or 6/4 or 5YR 4/3, 5/4, or 6/6. Moist color is 5YR 3/3, 4/3, or 4/4 or 7.5YR 4/3. Texture is gravelly clay loam, clay loam,

cobbly clay loam, or silty clay loam. The content of clay ranges from 35 to 40 percent. The horizon has 5 to 15 percent gravel and 0 to 10 percent cobbles. Reaction is slightly acid or neutral.

The 2Bt horizon has dry color of 7.5YR 5/3 or 5/4, 5YR 5/3, or 10YR 5/3. Moist color is 5YR 4/3, 7.5YR 4/3, or 10YR 5/2. Texture is clay, gravelly clay, or very gravelly clay. The content of clay ranges from 40 to 60 percent. The horizon has 10 to 30 percent gravel and 0 to 15 percent cobbles. Reaction ranges from neutral to moderately alkaline.

Farwell Series

The Farwell series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on flood plains. Slopes range from 0 to 2 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Fluventic Haploxerepts

Typical Pedon

Farwell clay loam, on a slope of less than 1 percent, under a cover of beans, at an elevation of 145 feet (44 m). When described on 10/24/1988, the soil was moist below a depth of 10 inches (25 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); brown (10YR 5/3) clay loam, very dark grayish brown (10YR 3/2) moist; 29 percent clay; moderate very fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine and fine irregular pores; 2 percent fine gravel; slightly alkaline, pH 7.7 by pH meter 1:1 water; abrupt smooth boundary.

ABt—5 to 9 inches (13 to 23 cm); grayish brown (10YR 5/2) clay loam, dark grayish brown (10YR 4/2) moist; 29 percent clay; moderate fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine tubular pores; few thin clay films on faces of peds; 2 percent fine gravel; slightly alkaline, pH 7.5 by pH meter 1:1 water; clear smooth boundary.

Bt1—9 to 18 inches (23 to 46 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 29 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine and common fine tubular pores; common thin clay films on faces of peds; 2 percent fine gravel; slightly alkaline, pH 7.4 by pH meter 1:1 water; clear smooth boundary.

Bt2—18 to 26 inches (46 to 66 cm); brown (10YR 5/3) clay loam, dark brown (10YR 3/3) and very dark brown (10YR 2/2) moist; 27 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine and common fine tubular pores; 2 percent fine gravel; common thin clay films on faces of peds; neutral, pH 7.2 by pH meter 1:1 water; clear smooth boundary.

Bt3—26 to 33 inches (66 to 84 cm); brown (10YR 5/3) clay loam, brown (10YR 4/3) moist; 28 percent clay; moderate fine subangular blocky structure; slightly hard, friable, sticky, slightly plastic; few very fine roots; many very fine and common fine tubular pores; common thin clay films on faces of peds; 2 percent fine gravel; neutral, pH 7.3 by pH meter 1:1 water; clear smooth boundary.

2Btb1—33 to 43 inches (84 to 109 cm); light yellowish brown (10YR 6/4) clay loam, brown (10YR 4/3) moist; 35 percent clay; weak medium prismatic structure parting to moderate fine angular blocky; slightly hard, friable, sticky, plastic; few very fine and common fine roots; many very fine and few fine and medium tubular

pores; nearly continuous thin clay films on faces of peds; 2 percent fine gravel; neutral, pH 7.3 by pH meter 1:1 water; clear smooth boundary.

2Btb2—43 to 57 inches; (109 to 145 cm) light yellowish brown (10YR 6/4) clay loam, brown (10YR 4/3) moist; 34 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; common thin clay films on faces of peds; 2 percent fine gravel; slightly alkaline, pH 7.6 by pH meter 1:1 water; clear smooth boundary.

2Btb3—57 to 72 inches (145 to 183 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 31 percent clay; massive; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; few thin clay films on faces of peds; 2 percent fine gravel; slightly alkaline, pH 7.5 by pH meter 1:1 water; clear smooth boundary.

3Bwb—72 to 81 inches (183 to 205 cm); dark grayish brown (10YR 4/2) loam, very dark grayish brown (10YR 3/2) moist; 20 percent clay; massive; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; few thin clay films on faces of peds; 2 percent fine gravel; slightly alkaline, pH 7.6 by pH meter 1:1 water.

Type location: Butte County, California; about 0.2 mile south of Wilson Landing Road, about 2 miles east of the west end of the road, approximately 175 feet south of the fourth power pole south of the road, 1,000 feet south and 2,500 feet west of the northwest corner of sec. 3, T. 22 N., R. 1 W.; in an unsectionized area in the Bosquejo Land Grant; 39 degrees, 47 minutes, 42 seconds north latitude and 121 degrees, 0 minutes, 2 seconds west longitude; NAD27; USGS Quad: Nord, California.

Range in Characteristics

Depth to the buried soil is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 60 to 62 degrees F (16 to 17 degrees C). The soil moisture control section is dry from about May 15 to October 31 (approximately 150 to 180 days). The particle-size control section averages 27 to 35 percent clay. Mineralogy is mixed. The content of organic matter decreases irregularly with increasing depth. The content of rock fragments is 0 to 5 percent. In some pedons the soils have no clay films.

The A or Ap horizon has dry color of 10YR 4/2, 4/3, 5/2, 5/3, or 6/3. Moist color is 10YR 2/2, 3/2, 3/3, or 4/3 or 7.5YR 3/2, 3/3, or 3/4. Texture is clay loam, loam, or silt loam. The content of clay ranges from 12 to 35 percent. The content of gravel is 0 to 2 percent. The content of organic matter is 1 to 2.5 percent. Reaction ranges from slightly acid to slightly alkaline.

The ABt horizon, the Bw horizon (where it occurs), and the Bt horizon have dry color of 10YR 5/2, 5/3, or 5/4 or 7.5YR 4/2 or 5/2. Moist color is 10YR 3/2, 3/3, or 4/3 or 7.5YR 3/2, 3/3, or 3/4. Texture is clay loam, silty clay loam, loam, or silt loam. The content of clay ranges from 20 to 35 percent. The content of gravel is 0 to 3 percent. The content of organic matter is 1 to 2.5 percent. Reaction ranges from neutral to moderately alkaline.

The 2Btb or Btb horizon has dry color of 10YR 3/2, 4/2, 5/2, or 5/3 or 7.5YR 5/2. Moist color is 10YR 3/2, 3/3, or 4/3 or 7.5YR 3/2, 3/3, or 3/4. Texture is clay loam or silty clay loam. The content of clay ranges from 27 to 40 percent. The content of gravel is 0 to 5 percent. The content of organic matter is 0.1 to 2 percent. Reaction is neutral or slightly alkaline.

The 3Bwb horizon, where it occurs, has dry color of 10YR 3/2, 4/2, 5/2, or 5/3 or 7.5YR 5/2. Moist color is 10YR 3/2, 3/3, 4/3, 4/4, or 5/4 or 7.5YR 3/2, 3/3, or 3/4. Texture is loam, silt loam, clay loam, or silty clay loam. The content of clay ranges from 20 to 30 percent. The content of gravel is 0 to 5 percent. The content of organic matter is 0.1 to 2 percent. The horizon is noneffervescent or slightly effervescent. Reaction is neutral or slightly alkaline.

Featherfalls Series

The Featherfalls series consists of very deep, well drained soils that formed in residuum and colluvium derived from coarse grained intrusive igneous rocks, mainly trondhjemite and quartz diorite. These soils are on ridgetops and side slopes on granitic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 58 inches (1,473 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Ultic Palexeralfs

Typical Pedon

Featherfalls sandy loam, on a northwest-facing slope of 28 percent, under a cover of conifers, hardwoods, and shrubs, at an elevation of 2,840 feet (866 m). When described on 7/14/1998, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed leaves, needles, and twig litter; abrupt smooth boundary.

A1—1 to 4 inches (3 to 10 cm); pale brown (10YR 6/3) sandy loam, brown (7.5YR 4/3) moist; 14 percent clay; moderate fine subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; many very fine roots; many very fine irregular pores; 10 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.0; abrupt smooth boundary.

A2—4 to 7 inches (10 to 18 cm); very pale brown (10YR 7/4) sandy loam, brown (7.5YR 5/4) moist; 18 percent clay; moderate fine subangular blocky structure; slightly hard, firm, slightly sticky, moderately plastic; common fine and medium roots; many very fine irregular pores; 2 percent mica flakes; 10 percent subrounded gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.8; clear smooth boundary.

Bt1—7 to 17 inches (18 to 43 cm); light brown (7.5YR 6/4) sandy clay loam, strong brown (7.5YR 4/6) moist; 24 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common fine and medium and few coarse roots; common very fine tubular pores; 5 percent discontinuous prominent clay films on faces of peds and in pores; 10 percent mica flakes; 10 percent subrounded gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.8; gradual smooth boundary.

Bt2—17 to 24 inches (43 to 61 cm); reddish yellow (7.5YR 7/6) sandy clay loam, yellowish red (5YR 4/6) moist; 29 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few medium and coarse roots; common very fine tubular pores; 60 percent discontinuous prominent clay films on faces of peds and in pores; 10 percent fine irregular black (N 2/0) iron-manganese masses; 20 percent mica flakes; 5 percent subrounded gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt3—24 to 32 inches (61 to 81 cm); reddish yellow (7.5YR 7/6) sandy clay loam, yellowish red (5YR 5/6) moist; 30 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine and medium roots; common very fine tubular pores; 60 percent discontinuous prominent clay films on faces of peds and in pores; 25 percent mica flakes; 5 percent subrounded gravel; moderately acid, pH 6.0 by Hellige-Truog; gradual smooth boundary.

Bt4—32 to 42 inches (81 to 107 cm); reddish yellow (7.5YR 7/6) sandy clay loam, strong brown (7.5YR 4/6) moist; 33 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine and

medium roots; common very fine tubular pores; 50 percent discontinuous prominent clay films on faces of peds and in pores; 25 percent mica flakes; moderately acid, pH 6.0 by Hellige-Truog; gradual smooth boundary.

BCt1—42 to 61 inches (107 to 155 cm); reddish yellow (7.5YR 7/6) paracobbly sandy clay loam, strong brown (7.5YR 4/6) moist; 34 percent clay; moderate medium subangular blocky structure; hard, very firm, moderately sticky, moderately plastic; few fine and medium roots; few very fine tubular pores; 80 percent continuous prominent clay films on faces of peds and in pores; 25 percent mica flakes; 33 percent paracobbles; moderately acid, pH 6.0 by Hellige-Truog; gradual smooth boundary.

BCt2—61 to 72 inches (155 to 183 cm); reddish yellow (7.5YR 7/6) paracobbly sandy clay loam, strong brown (7.5YR 4/6) moist; 33 percent clay; weak medium subangular blocky structure; hard, very firm, moderately sticky, moderately plastic; few fine and medium roots; few very fine tubular pores; 60 percent continuous prominent clay films on faces of peds and in pores; 10 percent mica flakes; 33 percent paracobbles; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Crt—72 to 80 inches (183 to 203 cm); pink (7.5YR 8/4) very paragravelly sandy clay loam, brown (7.5YR 5/4) moist; 25 percent clay; massive parting to weak medium subangular blocky structure; hard, very firm, slightly sticky, slightly plastic; few fine and medium roots; few very fine tubular pores; 50 percent discontinuous prominent clay films on faces of peds and in pores; 10 percent mica flakes; 45 percent paragravel; moderately acid, pH 6.0 by Hellige-Truog; rock structure is evident; slakes in water.

Type location: Butte County, California; about 0.8 mile north of Feather Falls, approximately 750 feet east and 200 feet north of the southeast corner of sec. 12, T. 20 N., R. 6 E.; 39 degrees, 36 minutes, 22 seconds north latitude and 121 degrees, 15 minutes, 26 seconds west longitude; NAD83; USGS Quad: Forbestown, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 53 to 59 degrees F (12 to 15 degrees C). The particle-size control section averages 20 to 27 percent clay and 0 to 25 percent rock fragments, mostly gravel. Mineralogy is mixed. NaF pH is less than 9.0 to 10.0 throughout the profile. Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 25 percent boulders.

The A horizon has dry color of 10YR 5/3, 5/4, 6/3, 6/4, 7/2, 7/3, 7/4, or 8/3 or 7.5YR 6/4. Moist color is 10YR 3/2, 3/3, 4/2, 4/3, 4/4, 5/2, 5/4, or 6/4 or 7.5YR 3/3, 4/2, 4/3, 4/4, or 5/4. Texture is sandy loam, coarse sandy loam, loam, sandy clay loam, or gravelly coarse sandy loam. The content of clay ranges from 8 to 23 percent. The content of gravel is 0 to 30 percent. The content of organic matter is 1 to 4 percent. Reaction ranges from strongly acid to slightly acid.

The Bt horizon has dry color of 10YR 7/3, 7/4, 7/6, 8/3, or 8/4; 7.5YR 6/4, 6/6, or 7/6; or 5YR 5/4, 5/6, or 6/6. Moist color is 10YR 5/3, 5/4, 5/6, 6/6, or 7/4; 7.5YR 4/3, 4/4, 4/6, 5/6, 6/6, or 5/8; 5YR 4/4, 4/6, 5/6, or 5/8; or 2.5YR 4/6, 5/6, or 5/8. Texture is sandy clay loam, clay loam, loam, sandy loam, or gravelly sandy clay loam. The content of clay ranges from 16 to 33 percent. The content of gravel is 0 to 30 percent. The content of organic matter is 0.1 to 1.5 percent. Reaction ranges from strongly acid to neutral.

The BCt horizon has dry color of 10YR 8/4 or 7.5YR 5/4, 6/6, 7/6, or 8/2. Moist color is 10YR 7/6, 7.5YR 4/6 or 7/6, or 5YR 4/4 or 5/6. Texture is sandy clay loam, sandy clay, or paracobbly sandy clay loam. The content of clay ranges from 25 to 38 percent. The horizon has 0 to 10 percent gravel and 5 to 35 percent paracobbles. The

content of organic matter is 0 to 0.2 percent. Reaction is moderately acid or slightly acid.

The Crt horizon has dry color of 7.5YR 8/4 or 10YR 8/4. Moist color is 7.5YR 5/4 or 10YR 7/6. Texture is sandy clay loam, sandy loam, very paragravelly sandy clay loam, extremely paragravelly loamy coarse sand, or loamy coarse sand. The content of clay ranges from 2 to 27 percent. The content of paragravel is 0 to 70 percent. Reaction ranges from very strongly acid to moderately acid.

Fernandez Series

The Fernandez series consists of very deep, moderately well drained soils that formed in alluvium derived from metamorphic and igneous rocks. These soils are on intermediate terraces. Slopes range from 0 to 9 percent. The mean annual precipitation is about 24 inches (610 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Ultic Palexeralfs

Typical Pedon

Fernandez sandy loam, on a west-facing slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 190 feet (58 m). When described on 4/30/1997, the soil was dry to a depth of 18 inches (46 cm) and slightly moist from 18 to 73 inches (46 to 185 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/4) sandy loam, dark reddish brown (5YR 3/4) moist; 18 percent clay; strong thin platy structure parting to moderate fine subangular blocky; slightly hard, friable, nonsticky, slightly plastic; many very fine roots; few very fine tubular pores; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); yellowish red (5YR 5/6) sandy clay loam, dark red (2.5YR 3/6) moist; 24 percent clay; strong medium subangular blocky structure; extremely hard, friable, slightly sticky, moderately plastic; common very fine roots; few very fine tubular pores; 10 percent clay films on all faces of peds; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt2—6 to 18 inches (15 to 46 cm); yellowish red (5YR 5/6) sandy clay loam, dark reddish brown (2.5YR 3/4) moist; 28 percent clay; moderate medium subangular blocky structure parting to strong fine granular; slightly hard, firm, slightly sticky, moderately plastic; few very fine and fine roots; few fine and common very fine tubular pores; 10 percent clay films on faces of peds; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt wavy boundary.

2Bt3—18 to 28 inches (46 to 71 cm); red (2.5YR 5/6) clay loam, dark reddish brown (2.5YR 3/4) moist; 38 percent clay; strong medium angular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few very fine and fine roots; common very fine tubular pores; 40 percent clay films on faces of peds; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

2Bt4—28 to 44 inches (71 to 112 cm); red (2.5YR 5/6) clay loam, reddish brown (2.5YR 4/4) moist; 38 percent clay; strong medium angular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few fine roots; few fine and common very fine tubular pores; 50 percent clay films on faces of peds; 5 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

2Bt5—44 to 57 inches (112 to 145 cm); red (2.5YR 5/6) clay, dark red (2.5YR 3/6) moist; 42 percent clay; strong medium angular blocky structure; extremely hard,

very firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; 60 percent clay films on faces of peds; 5 percent fine distinct threadlike iron depletions having diffuse boundaries and lining pores; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

2Bt6—57 to 65 inches (145 to 165 cm); red (2.5YR 5/6) gravelly clay, dark red (2.5YR 3/6) moist; 45 percent clay; strong medium subangular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; 40 percent clay films on faces of peds; 5 percent fine distinct threadlike iron depletions having diffuse boundaries and lining pores; 20 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

2Bt7—65 to 73 inches (165 to 185 cm); red (10R 5/6) gravelly clay loam, dark red (10R 3/6) moist; 37 percent clay; strong medium subangular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; 30 percent clay films on faces of peds; 20 percent very coarse distinct irregular iron depletions that have diffuse boundaries and are around rock fragments; 25 percent well rounded gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt wavy boundary.

3Btq—73 to 85 inches (185 to 216 cm); duripan; yellowish red (5YR 5/6) gravelly sandy loam, dark reddish brown (5YR 3/4) moist; 5 percent clay; massive; extremely hard, very firm, weakly cemented by silica, nonsticky, nonplastic; few very fine tubular pores; 20 percent clay films on rock fragments; 20 percent fine mica flakes throughout; 20 percent well rounded gravel; slightly acid, pH 6.2 by Hellige-Truog; does not slake in water after 2 hours; about 75 percent weakly cemented and 25 percent moderately cemented.

Type location: Butte County, California; about 6.43 miles southeast of Nelson, approximately 500 feet west and 2,700 feet south of the northeast corner of sec. 8, T. 19 N., R. 3 E.; 39 degrees, 30 minutes, 59 seconds north latitude and 121 degrees, 39 minutes, 8 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

Depth to a weakly cemented or moderately cemented duripan ranges from 60 to 80 inches (152 to 205 cm) or more, and depth to the 2Bt horizon ranges from 18 to 49 inches (46 to 124 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 20 to 35 percent clay and 0 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 40 inches (102 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 2 to 15 percent gravel.

The A horizon has dry color of 7.5YR 5/4, 5/6, or 6/4. Moist color is 5YR 3/3, 3/4, or 4/3 or 7.5YR 3/4 or 4/4. Texture is sandy loam, fine sandy loam, gravelly sandy loam, or gravelly loam. The content of clay ranges from 15 to 18 percent. The content of gravel is 5 to 20 percent. The content of organic matter is 0.5 to 1.2 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 5/6 or 6/6 or 7.5YR 6/4 or 6/6. Moist color is 2.5YR 3/4, 3/6, or 4/4; 5YR 3/4 or 4/4; or 7.5YR 3/4 or 4/4. Texture is sandy clay loam, gravelly sandy clay loam, loam, clay loam, or sandy loam. The content of clay ranges from 18 to 30 percent. The content of gravel is 5 to 33 percent. Redoximorphic features range from 0 to 20 percent soft oxidized iron masses and 0 to 5 percent soft manganese masses. The content of organic matter is 0.1 to 0.5 percent. Reaction ranges from moderately acid to neutral.

The 2Bt horizon has dry color of 2.5YR 4/8 or 5/6, 10R 5/6, 5YR 5/6 or 6/6, or 7.5YR 5/4, 6/6, or 7/6. Moist color is 2.5YR 3/4, 3/6, 4/4, or 4/6; 10R 3/6 or 4/6; 5YR 4/6; or 7.5YR 4/4 or 4/6. Texture is clay loam, clay, sandy clay, gravelly clay, or very

gravelly sandy clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 2 to 45 percent. Redoximorphic features range from 0 to 5 percent iron depletions, 0 to 15 percent soft oxidized iron masses, and 0 to 10 percent soft manganese masses. The content of organic matter is 0.1 to 0.5 percent. Reaction ranges from moderately acid to neutral.

Flagcanyon Series

The Flagcanyon series consists of moderately deep, moderately well drained soils that formed in alluvium derived from basalt. These soils are on alluvial fans on Table Mountain. Slopes range from 2 to 5 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Haplic Durixeralfs

Typical Pedon

Flagcanyon gravelly loam, on a west-facing slope of 4 percent, under a cover of olive trees, at an elevation of 380 feet (116 m). When described on 7/16/2001, the soil was dry to a depth of 30 inches (76 cm) and moist from 30 to 65 inches (76 to 165 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (10YR 4/3) gravelly loam, dark brown (10YR 3/3) moist; 18 percent clay; moderate fine subangular blocky structure; hard, friable, slightly sticky, slightly plastic; many very fine roots; many fine irregular pores; 10 percent subrounded cobbles and 20 percent subrounded basalt gravel; very strongly acid, pH 5.1 by Hellige-Truog; clear smooth boundary.

Bt1—3 to 9 inches (8 to 23 cm); brown (10YR 4/3) very gravelly loam, dark yellowish brown (10YR 3/4) moist; 25 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, slightly sticky, moderately plastic; common fine and medium roots between peds; common fine and medium irregular pores; 20 percent discontinuous faint clay films on surfaces along pores; 10 percent subrounded basalt cobbles and 30 percent subrounded basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; clear wavy boundary.

Bt2—9 to 14 inches (23 to 36 cm); dark yellowish brown (10YR 4/4) very gravelly loam, dark yellowish brown (10YR 3/4) moist; 27 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common very fine to coarse roots between peds; common very fine to medium and few coarse tubular pores; 30 percent discontinuous distinct clay films on surfaces along pores; 10 percent subrounded basalt cobbles and 40 percent subrounded basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

2Bt3—14 to 30 inches (36 to 76 cm); dark yellowish brown (10YR 4/4) very gravelly clay loam, dark yellowish brown (10YR 3/4) moist; 30 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common fine and medium roots around fragments; common fine and medium irregular pores; 40 percent discontinuous distinct clay films on surfaces along pores; 20 percent subrounded basalt cobbles and 40 percent subrounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt wavy boundary.

3Btq1—30 to 53 inches (76 to 135 cm); duripan; yellowish brown (10YR 5/4) extremely gravelly sandy clay loam, dark yellowish brown (10YR 4/4) moist; 34 percent clay; moderate medium angular blocky structure; very hard, very firm, moderately cemented by silica, moderately sticky, moderately plastic; common very fine and fine roots around fragments; few fine irregular pores; 60 subrounded

basalt cobbles and 50 percent subrounded basalt gravel; neutral, pH 6.8 by Hellige-Truog; abrupt wavy boundary.

3Btq2—53 to 65 inches (135 to 165 cm); duripan; yellowish brown (10YR 5/4) extremely gravelly sandy clay, 40 percent dark yellowish brown (10YR 4/6) and 60 percent dark yellowish brown (10YR 4/4) moist; 36 percent clay; moderate medium angular blocky structure; very hard, very firm, moderately cemented by silica, moderately sticky, moderately plastic; few very fine roots around fragments; few very fine irregular pores; 45 percent continuous distinct clay films on rock fragments; 20 percent subrounded basalt cobbles and 60 percent subrounded basalt gravel; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 6.1 miles northwest of Oroville, approximately 1,000 feet east and 1,400 feet south of the northwest corner of sec. 14, T. 20 N., R. 3 E.; 39 degrees, 35 minutes, 34 seconds north latitude and 121 degrees, 36 minutes, 31 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 27 to 35 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 11 inches (28 cm) below the surface of the soil from December through April. Redoximorphic features, such as soft manganese masses with color of N 2/0, occur in the Bt and 2Bt horizons. Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 15 percent cobbles.

The A horizon has dry color of 10YR 4/3 or 7.5YR 4/3 or 5/3. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2 or 3/3. Texture is gravelly loam, loam, or fine sandy loam. The content of clay ranges from 15 to 22 percent. The horizon has 0 to 20 percent gravel and 0 to 10 percent cobbles. The content of organic matter is 4 to 8 percent. Reaction ranges from strongly acid to slightly acid.

The Bt horizon has dry color of 10YR 4/3, 4/4, or 5/3; 7.5YR 4/3, 4/4, or 5/3; or 5YR 4/4. Moist color is 10YR 3/4; 7.5YR 3/4, 4/2, 4/3, or 4/4; or 5YR 3/4. Texture is very gravelly loam, very gravelly clay loam, extremely gravelly clay loam, or gravelly loam. The content of clay ranges from 22 to 60 percent. The horizon has 15 to 60 percent gravel and 0 to 30 percent cobbles. The content of organic matter is 1 to 4 percent. Reaction ranges from strongly acid to neutral.

The 2Bt horizon has dry color of 10YR 4/3, 4/4, or 5/3; 7.5YR 4/3 or 4/4; or 5YR 4/4. Moist color is 10YR 3/4 or 4/3, 7.5YR 3/4 or 4/3, or 5YR 3/4. Texture is very gravelly clay loam, extremely gravelly clay loam, or extremely gravelly clay. The content of clay ranges from 35 to 50 percent. The horizon has 40 to 60 percent gravel and 0 to 20 percent cobbles. The content of organic matter is 1 to 2 percent. Reaction ranges from moderately acid to neutral.

The 3Btq horizon has dry color of 10YR 5/4, 5/6, 8/4, or 8/6 or 7.5YR 4/4. Moist color is 10YR 4/4, 4/6, or 7/6 or 7.5YR 3/4. Texture is extremely gravelly sandy clay loam or extremely gravelly sandy clay. The content of clay ranges from 22 to 50 percent. The horizon has 45 to 60 percent gravel and 20 to 40 percent cobbles. The horizon is slightly cemented or moderately cemented. The content of organic matter is 0.2 to 1 percent. Reaction ranges from neutral to moderately alkaline.

Flagcanyon Taxadjunct

The Flagcanyon taxadjunct consists of moderately deep, moderately well drained soils that formed in alluvium derived from basalt. These soils are on mounds on fan terraces. Slopes range from 0 to 5 percent. The mean annual precipitation is about 26

inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Haplic Durixeralfs

Typical Pedon

Flagcanyon taxadjunct fine sandy loam, on a southwest-facing slope of 2 percent, under a cover of annual grasses and forbs, at an elevation of 342 feet (104 m). When described on 5/8/2001, the soil was dry to a depth of 7 inches (0 to 18 cm), slightly moist from 7 to 31 inches (18 to 79 cm), and dry from 31 to 63 inches (79 to 160 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (7.5YR 4/3) fine sandy loam, dark brown (7.5YR 3/2) moist; 18 percent clay; moderate thick platy structure parting to moderate fine subangular blocky; slightly hard, friable, slightly sticky, nonplastic; many very fine roots; many very fine irregular pores; 10 percent very fine irregular oxidized iron masses throughout; 10 percent mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—3 to 7 inches (8 to 18 cm); brown (7.5YR 4/3) loam, dark brown (7.5YR 3/2) moist; 24 percent clay; moderate medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; few fine tubular pores; 15 percent discontinuous distinct clay films on faces of peds; 10 percent mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt2—7 to 16 inches (18 to 41 cm); brown (7.5YR 4/3) clay loam, dark reddish brown (5YR 3/2) moist; 29 percent clay; moderate medium subangular blocky structure; hard, firm, slightly sticky, moderately plastic; common very fine roots; common fine, few medium, and many very fine tubular pores; 40 percent discontinuous distinct clay films on faces of peds; 10 percent mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

2Bt3—16 to 23 inches (41 to 58 cm); brown (10YR 5/3) very gravelly clay, brown (10YR 4/3) moist; 45 percent clay; moderate fine subangular blocky structure; very hard, very firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; 60 percent continuous prominent clay films on faces of peds; 40 percent very fine irregular manganese masses throughout; 5 percent basalt cobbles and 50 percent basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual wavy boundary.

2Bt4—23 to 31 inches (58 to 79 cm); light yellowish brown (10YR 6/4) extremely gravelly clay, dark yellowish brown (10YR 4/4) moist; 50 percent clay; moderate fine subangular blocky structure; very hard, very firm, extremely weakly cemented, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; 80 percent continuous prominent clay films on faces of peds; 30 percent very fine irregular manganese masses around rock fragments; 5 percent basalt cobbles and 50 percent basalt gravel; neutral, pH 7.0 by Hellige-Truog; clear wavy boundary.

3Bq—31 to 63 inches (79 to 160 cm); extremely weakly cemented duripan; very pale brown (10YR 7/4) extremely gravelly sand, yellowish brown (10YR 5/4) moist; 2 percent clay; extremely weakly cemented by silica; 30 percent very fine irregular manganese masses around rock fragments; 20 percent basalt cobbles and 65 percent basalt gravel; neutral, pH 7.0 by Hellige-Truog;

Type location: Butte County, California; about 3.8 miles northwest of Oroville, approximately 350 feet west and 2,100 feet south of the northeast corner of sec. 26, T. 20 N., R. 3 E.; 39 degrees, 33 minutes, 42 seconds north latitude and 121 degrees, 35 minutes, 50 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). Depth to an indurated duripan is more than 40 inches (102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 28 to 35 percent clay and 20 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 0.5 to 1.5 percent in the A horizon and is less than 1 percent in the Bt and 2Bt horizons. A fluctuating water table can occur at a depth of 16 to 40 inches (41 to 102 cm) from December through April. Rock fragments on the surface range from 0 to 5 percent gravel.

The A horizon has dry color of 7.5YR 4/3 or 10YR 4/3, 4/4, or 5/3. Moist color is 7.5YR 3/2 or 3/3. Texture is fine sandy loam, loam, or gravelly fine sandy loam. The content of clay ranges from 15 to 18 percent. The content of gravel is 5 to 20 percent. Redoximorphic features range from 0 to 10 percent oxidized iron masses. Reaction is moderately acid.

The Bt horizon has dry color of 7.5YR 4/3 or 5/3 or 10YR 4/4 or 5/3. Moist color is 7.5YR 3/2, 3/3, or 4/3 or 5YR 3/2. Texture is loam, clay loam, gravelly loam, or gravelly clay loam. The content of clay ranges from 24 to 32 percent. The content of gravel is 5 to 30 percent. Reaction ranges from strongly acid to slightly acid.

The 2Bt horizon has dry color of 10YR 5/3, 6/3, or 6/4 or 7.5YR 5/3 or 5/4. Moist color is 10YR 4/3, 4/4, 5/3, or 5/4; 7.5YR 4/3; or 5YR 4/4. Texture is very gravelly clay, very gravelly clay loam, extremely gravelly sandy clay, or extremely gravelly clay. The content of clay ranges from 35 to 50 percent. The horizon has 45 to 65 percent gravel and 0 to 20 percent cobbles. Redoximorphic features range from 0 to 40 percent manganese masses. Reaction ranges from moderately acid to neutral.

The 3Bq horizon has dry color of 10YR 7/4 or 7.5YR 6/3. Moist color is 10YR 5/4 or 5/6 or 7.5YR 4/3. Texture is extremely gravelly sand or extremely gravelly coarse sand. The content of clay ranges from 2 to 5 percent. The horizon has 60 to 65 percent gravel and 10 to 20 percent cobbles. Redoximorphic features range 30 to 60 percent manganese masses. Reaction is slightly acid or neutral. Cementation ranges from extremely weak to strong.

The Flagcanyon taxadjunct in map unit 377 is a taxadjunct because it has a fine-loamy particle-size control section, whereas the Flagcanyon series is loamy-skeletal. The main limitation is depth to the duripan. The difference does not significantly affect the use, management, or interpretations of the soil.

Flanly Series

The Flanly series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from intrusive igneous rocks, mainly quartz diorite. These soils are on ridgetops and side slopes on Sierra Nevada foothills. Slopes range from 2 to 50 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Ultic Haploxeralfs

Typical Pedon

Flanly loam, on a north-facing slope of 8 percent, under a cover of blue oak and scattered foothill pine, whiteleaf manzanita, wild oat, annual fescue, and soft chess, at an elevation of 1,800 feet (549 m). When described on 6/11/2002, the soil was slightly moist below the surface layer. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); yellowish brown (10YR 5/4) loam, dark brown (10YR 3/3) moist; 14 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; many very fine roots

throughout; many very fine and fine tubular pores; 5 percent fine spherical oxidized iron masses between peds; 3 percent subangular gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

BA—2 to 5 inches (5 to 13 cm); dark yellowish brown (10YR 4/6) sandy loam, dark yellowish brown (10YR 3/4) moist; 15 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; many very fine roots throughout; many very fine and fine tubular pores; 5 percent fine threadlike and 10 percent fine spherical oxidized iron masses; 3 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt1—5 to 10 inches (13 to 25 cm); dark yellowish brown (10YR 4/6) sandy loam, dark yellowish brown (10YR 3/4) moist; 18 percent clay; strong very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and medium and many very fine roots throughout; many very fine and fine tubular pores; 10 percent patchy faint clay films on faces of peds; 2 percent subangular gravel; moderately acid, pH 6.1 by Hellige-Truog; clear wavy boundary.

Bt2—10 to 23 inches (25 to 58 cm); strong brown (7.5YR 4/6) sandy clay loam, dark brown (7.5YR 3/4) moist; 23 percent clay; strong fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and coarse and many very fine roots throughout; many very fine and fine tubular pores; 15 percent patchy distinct clay films on faces of peds; 5 percent subangular gravel; moderately acid, pH 6.1 by Hellige-Truog; clear wavy boundary.

Crt—23 to 26 inches (58 to 66 cm); moderately cemented quartz diorite bedrock; few very fine roots throughout; 15 percent patchy distinct clay films.

Type location: Butte County, California; about 2 miles northwest of Rackerby, approximately 2,500 feet north and 600 feet east of the southwest corner of sec. 31, T. 19 N., R. 6 E.; 39 degrees, 27 minutes, 38 seconds north latitude and 121 degrees, 21 minutes, 00 seconds west longitude; NAD83; USGS Quad: Rackerby, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 63 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about June through October (about 165 days). The particle-size control section averages 22 to 30 percent clay and 4 to 23 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 5 percent gravel, 0 to 3 percent cobbles, and 0 to 10 percent stones.

The A horizon has dry color of 10YR 4/4, 5/2, 5/3, 5/4, 5/6, or 6/4 or 7.5YR 4/4 or 5/6. Moist color is 10YR 3/2, 3/3, 3/4, or 4/4 or 7.5YR 3/4. Texture is loam or sandy loam. The content of clay ranges from 12 to 18 percent. The content of gravel is 3 to 15 percent. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 3 to 5 percent. Reaction ranges from slightly acid to very strongly acid.

The BA horizon has dry color of 10YR 4/4 or 4/6 or 7.5YR 4/6, 5/4, or 5/6. Moist color is 10YR 3/3 or 3/4 or 7.5YR 3/4. Texture is loam or sandy loam. The content of clay ranges from 15 to 20 percent. The content of gravel is 3 to 15 percent. The content of organic matter is 1 to 3 percent. By sum of cations, base saturation ranges from 60 to 70 percent. Reaction ranges from slightly acid to strongly acid.

The upper part of the Bt horizon has dry color of 10YR 4/6; 7.5YR 4/4, 4/6, 5/4, 5/6, 6/4, 5/8, 6/6, or 7/6; or 5YR 5/6 or 5/8. Moist color is 10YR 3/4, 7.5YR 3/4 or 4/6, or 5YR 3/4 or 4/6. Texture is loam, sandy loam, sandy clay loam, or clay loam. The content of clay ranges from 18 to 28 percent. The content of gravel is 2 to 15 percent.

The content of organic matter is 1 to 3 percent. By sum of cations, base saturation ranges from 60 to 74 percent. Reaction is moderately acid or slightly acid.

The lower part of the Bt horizon has dry color of 7.5YR 4/6 or 5/6 or 5YR 4/4, 5/6, or 5/8. Moist color is 7.5YR 3/4, 4/6, 4/4, or 5/6 or 5YR 4/4 or 4/6. Texture is loam, sandy clay loam, gravelly sandy clay loam, or clay loam. The content of clay ranges from 22 to 35 percent. The content of gravel is 3 to 20 percent. The content of organic matter is 0.5 to 2 percent. By sum of cations, base saturation ranges from 75 to 85 percent. Reaction ranges from moderately acid to neutral.

Flumewall Series

The Flumewall series consists of shallow, well drained soils that formed in residuum and colluvium derived from coarse grained metamorphic rocks, mainly metadiorite. These soils are on canyon side slopes on metamorphic Sierra Nevada mountains. Slopes range from 70 to 100 percent. The mean annual precipitation is about 74 inches (1,880 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Loamy-skeletal, isotic, mesic Lithic Haploxerults

Typical Pedon

Flumewall gravelly sandy loam, on an east-facing slope of 82 percent, under a cover of canyon live oak, Douglas-fir, sugar pine, and ponderosa pine, at an elevation of 3,320 feet (1,012 m). When described on 6/1/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); slightly decomposed plant material; abrupt smooth boundary.

A—0.5 inch to 2 inches (1 to 5 cm); light brown (7.5YR 6/4) gravelly sandy loam, brown (7.5YR 4/4) moist; 17 percent clay; moderate fine granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine to medium irregular and tubular pores; 5 percent cobbles and 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt1—2 to 7 inches (5 to 17 cm); light brown (7.5YR 6/4) very gravelly sandy loam, brown (7.5YR 4/4) moist; 19 percent clay; weak fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many very fine to medium roots; many very fine to medium irregular and tubular pores; 20 percent discontinuous faint clay films; 10 percent cobbles and 25 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt2—7 to 18 inches (17 to 46 cm); light brown (7.5YR 6/4) very stony sandy clay loam, strong brown (7.5YR 4/6) moist; 22 percent clay; weak fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many very fine to coarse roots; many very fine to medium tubular and irregular pores; 20 percent discontinuous faint clay films; 20 percent cobbles, 20 percent stones, and 25 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.0; abrupt irregular boundary.

R—18 inches (46 cm); indurated metadiorite bedrock.

Type location: Butte County, California; about 0.68 mile east-northeast of Stirling City, approximately 1,000 feet south and 1,400 feet east of the northwest corner of sec. 27, T. 24 N., R. 4 E.; 39 degrees 54 minutes, 44 seconds north latitude and 121 degrees, 31 minutes, 2 seconds west longitude; NAD83; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 47 to 55 degrees F (8 to 13 degrees C). The particle-size control section averages 14 to 27 percent clay and 35 to 75 percent rock fragments, mostly gravel. Mineralogy is isotic. NaF pH is 11 to 9.5 in the A and Bt horizons. Rock fragments on the surface range from 10 to 25 percent gravel, 0 to 25 percent cobbles, 0 to 15 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 7.5YR 6/3 or 6/4 or 10YR 6/3. Moist color is 7.5YR 4/3 or 4/4. Texture is gravelly fine sandy loam, gravelly sandy loam, cobbly fine sandy loam, or cobbly sandy loam. The content of clay ranges from 12 to 20 percent. The horizon has 15 to 80 percent gravel, 5 to 15 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders. Reaction is slightly acid or moderately acid.

The Bt horizon has dry color of 7.5YR 6/4 or 6/6 or 10YR 6/4. Moist color is 7.5YR 4/4 or 4/6, 10YR 5/4, or 5YR 4/6. Texture is gravelly fine sandy loam, very gravelly fine sandy loam, very gravelly sandy loam, very gravelly sandy clay loam, very stony sandy clay loam, or extremely stony sandy clay loam. The content of clay ranges from 14 to 27 percent. The horizon has 15 to 35 percent gravel, 10 to 25 percent cobbles, and 0 to 25 percent stones. Reaction ranges from slightly acid to strongly acid.

Fluvaquentic Humaquepts

Fluvaquentic Humaquepts consist of very deep, poorly drained soils that formed in alluvium derived from quartz diorite. These soils are in meadows in Sierra Nevada mountain valleys. Slopes range from 2 to 15 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, mesic Fluvaquentic Humaquepts

Typical Pedon

Fluvaquentic Humaquepts very fine sandy loam, on a southwest-facing slope of 1 percent, under a cover of corn lily, rush, sedge, and arnica, at an elevation of 4,450 feet (1,356 m). When described on 9/23/1996, the soil was dry to a depth of 45 inches (114 cm) and very moist from 45 to 60 inches (114 to 152 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 7 inches (0 to 18 cm); very dark grayish brown (10YR 3/2) very fine sandy loam, black (10YR 2/1) moist; 12 percent clay; weak very fine subangular blocky structure parting to moderate very fine granular; loose, very friable, nonsticky, nonplastic; many very fine roots; many very fine irregular pores; 2 percent mica flakes; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.0; abrupt smooth boundary.

A2—7 to 15 inches (18 to 38 cm); dark grayish brown (10YR 4/2) very fine sandy loam, black (10YR 2/1) moist; 15 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine roots; many very fine irregular pores; 2 percent mica flakes; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 11.0; clear smooth boundary.

Bw1—15 to 22 inches (38 to 56 cm); grayish brown (10YR 5/2) loam, black (10YR 2/1) moist; 20 percent clay; weak fine subangular blocky structure; soft, friable, nonsticky, slightly plastic; few very fine roots; common very fine tubular pores; 5 percent brown (7.5YR 4/4 moist) oxidized iron masses; 2 percent mica flakes; 2 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 11.5; clear smooth boundary.

Bw2—22 to 29 inches (56 to 74 cm); grayish brown (10YR 5/2) loam, very dark grayish brown (10YR 3/2) moist; 25 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 5 percent brown (7.5YR 4/4 moist) oxidized iron masses; 2 percent mica flakes; 2 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.5; abrupt smooth boundary.

Bw3—29 to 36 inches (74 to 91 cm); very pale brown (10YR 7/3) loam, brown (10YR 4/3) moist; 25 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 5 percent gray (10YR 5/1) iron depletions and 20 percent strong brown (7.5YR 4/8 moist) oxidized iron masses; 5 percent mica flakes; 5 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.0; abrupt smooth boundary.

2Bw—36 to 45 inches (91 to 114 cm); very pale brown (10YR 7/3) gravelly clay loam, brown (10YR 5/3) moist; 28 percent clay; moderate medium subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; common fine and few very fine tubular pores; 20 percent gray (10YR 5/1) iron depletions and 25 percent strong brown (7.5YR 4/8 moist) oxidized iron masses; 20 percent mica flakes; 20 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.5; abrupt smooth boundary.

2BC—45 to 60 inches (114 to 152 cm); white (10YR 8/1) gravelly loam, gray (10YR 6/1) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; common fine, few medium, and few very fine tubular pores; 10 percent olive gray (5Y 5/2) iron depletions, 10 percent strong brown (7.5YR 4/6 moist) oxidized iron masses, and 60 percent gray (2.5Y 5/1 moist) iron depletions; 30 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.5.

Type location: Plumas County, California; about 1.5 miles southeast of Cascade, approximately 2,025 feet east and 2,200 feet south of the northwest corner of sec. 11, T. 21 N., R. 7 E.; 39 degrees, 41 minutes, 50 seconds north latitude and 121 degrees, 9 minutes, 4 seconds west longitude; NAD83; USGS Quad: Cascade, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm), and depth to the 2BC horizon is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 52 to 56 degrees F (11 to 13 degrees C). The particle-size control section averages 20 to 25 percent clay and 0 to 1 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 5 to 10 percent to a depth of 15 inches (38 cm). By ammonium acetate, base saturation is assumed to be 35 to 50 percent throughout the profile. A fluctuating water table can occur from the surface of the soil to a depth of 60 inches (152 cm) from November through August. Rock fragments on the surface range from 0 to 5 percent gravel.

The A horizon has dry color of 10YR 3/2 or 4/2. Moist color is 10YR 2/1 or 2/2. Texture is very fine sandy loam. The content of clay ranges from 12 to 15 percent. The content of gravel is 0 to 10 percent. NaF pH is 10.0 to 11.0. Reaction is moderately acid or strongly acid.

The Bw horizon has dry color of 10YR 5/2, 6/2, 7/2, or 7/3. Moist color is 10YR 2/1, 3/2, 3/3, 4/3, or 5/3. Texture is loam. The content of clay ranges from 20 to 25 percent. The content of gravel is 0 to 5 percent. Redoximorphic features occur as iron masses or iron depletions. NaF pH is 9.0 to 11.0. Reaction is moderately acid or strongly acid.

The 2Bw horizon has dry color of 10YR 6/3, 7/3, or 8/3. Moist color is 10YR 4/3, 5/3, or 6/3. Texture is gravelly clay loam. The content of clay ranges from 27 to 30 percent. Redoximorphic features occur as iron masses or iron depletions. NaF pH is 9.0 to 9.5. Reaction is moderately acid or strongly acid.

The 2BC horizon has dry color of 10YR 6/1, 7/1, or 8/1. Moist color is 10YR 5/1, 6/1, or 7/1. Texture is gravelly or very gravelly loam. The content of clay ranges from 20 to 27 percent. The content of gravel is 20 to 30 percent. Redoximorphic features occur as iron masses or iron depletions. NaF pH is 9.0 to 9.5. Reaction is moderately acid or strongly acid.

Fluvaquents, Loamy

Fluvaquents, loamy, consist of very deep, somewhat poorly drained soils that formed in alluvium derived from granitic and metamorphic rocks. These soils are on low terraces in Sierra Nevada mountain valleys. Slopes range from 0 to 3 percent. The mean annual precipitation is about 55 inches (1,397 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Mesic Fluvaquents

Typical Pedon

Fluvaquents, loamy, on a west-facing slope of 1 percent, under a cover of ponderosa pine, white alder, bigleaf maple, black willow, arroyo willow, blackberry, horsetail, bull thistle, and sedge, at an elevation of 2,018 feet (615 m). When described on 9/26/02, the soil was dry to a depth of 37 inches (94 cm), slightly moist from 37 to 45 inches (94 to 114 cm), very moist from 45 to 65 inches (114 to 165 cm), and saturated below 65 inches (165 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); slightly decomposed plant material; abrupt smooth boundary.

A1—0.5 inch to 2 inches (1 to 6 cm); pale brown (10YR 6/3) loam, very dark grayish brown (10YR 3/2) moist; 23 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few fine and common very fine roots; many very fine and fine irregular and tubular and common medium tubular pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

A2—2 to 9 inches (6 to 23 cm); light brownish gray (10YR 6/2) loam, dark grayish brown (10YR 4/2) moist; 21 percent clay; moderate medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine to medium tubular pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bw1—9 to 18 inches (23 to 46 cm); pale brown (10YR 6/3) sandy clay loam, dark grayish brown (10YR 4/2) moist; 20 percent clay; moderate medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium tubular pores; 20 percent fine and medium irregular strong brown (7.5YR 5/6 dry) oxidized iron masses infused into matrix adjacent to pores; slightly acid, pH 6.5 by Hellige-Truog; gradual wavy boundary.

Bw2—18 to 24 inches (46 to 61 cm); light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; 27 percent clay; moderate medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; 15 percent fine and medium threadlike yellowish red (5YR 5/6 dry) oxidized iron masses infused into matrix adjacent to pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

C1—24 to 27 inches (61 to 69 cm); light brownish gray (10YR 6/2) sandy loam, dark grayish brown (10YR 4/2) moist; 15 percent clay; massive; slightly hard, very friable, slightly sticky, nonplastic; few very fine to medium roots; many very fine and fine tubular and irregular and common medium tubular pores; 10 percent fine and medium irregular strong brown (7.5YR 5/6 dry) oxidized iron masses infused

into matrix adjacent to pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

C2—27 to 37 inches (69 to 94 cm); grayish brown (2.5Y 5/2) silt loam, dark grayish brown (2.5Y 4/2) moist; 18 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; 10 percent fine and medium irregular yellowish brown (10YR 5/6 dry) oxidized iron masses infused into matrix adjacent to pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Agb1—37 to 45 inches (94 to 114 cm); gray (2.5Y 6/1) loam, very dark gray (10YR 3/1) moist; 20 percent clay; massive; moderately hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium tubular pores; 10 percent fine threadlike strong brown (7.5YR 4/6 moist) oxidized iron masses infused into matrix adjacent to pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Agb2—45 to 65 inches (114 to 165 cm); gray (2.5Y 6/1) sandy clay loam, dark gray (2.5Y 4/1) moist; 25 percent clay; massive; moderately hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine tubular pores; 5 percent fine threadlike strong brown (7.5YR 4/6 moist) oxidized iron masses infused into matrix adjacent to pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Agb3—65 to 70 inches (165 to 178 cm); gray (2.5Y 6/1) sandy loam, dark gray (2.5Y 4/1) moist; 16 percent clay; massive; slightly hard, friable, slightly sticky, nonplastic; common very fine roots; common very fine tubular pores; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

2Cg—70 to 85 inches (178 to 216 cm); gray (2.5Y 6/1) sandy clay loam, dark gray (2.5Y 4/1) moist; 28 percent clay; massive; moderately hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine tubular pores; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Butte County, California; about 0.25 mile east of Concow Reservoir, approximately 700 feet south and 1,720 feet west of the northeast corner of sec. 15, T. 22 N., R. 4 E.; 39 degrees, 45 minutes, 59 seconds north latitude and 121 degrees, 30 minutes, 41 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 50 to 55 degrees F (10 to 13 degrees C). The soil moisture control section is dry in all parts from about August to October (about 90 days). The particle-size control section averages 12 to 27 percent clay and 0 to 15 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur at a depth of 10 to 59 inches (25 to 150 cm) from December through June and at a depth of 47 to 67 inches (10 to 170 cm) from July through November. Redoximorphic features, such as soft iron masses with color of 7.5YR 5/6 and 4/6, occur throughout the profile. Rock fragments on the surface range from 0 to 15 percent gravel.

The A horizon has dry color of 10YR 6/2 or 6/3. Moist color is 10YR 3/2 or 4/2. Texture is loam or fine sandy loam. The content of clay ranges from 12 to 27 percent. The content of gravel is 0 to 15 percent. Reaction is slightly acid or neutral.

The Bw horizon has dry color of 10YR 6/2 or 6/3. Moist color is 10YR 4/2 or 4/3. Texture is sandy clay loam, silt loam, loam, fine sandy loam, or sandy loam. The content of clay ranges from 12 to 27 percent. The content of gravel is 0 to 15 percent. Reaction is slightly acid or neutral.

The C horizon has dry color of 10YR 5/2 or 6/2 or 2.5Y 5/2. Moist color is 10YR 4/2 or 2.5Y 4/2. Texture is sandy loam, silt loam, fine sandy loam, or loam. The content of

clay ranges from 10 to 20 percent. The content of gravel is 0 to 15 percent. Reaction is slightly acid or neutral.

The Abg horizon has dry color of 2.5Y 5/1 or 6/1. Moist color is 10YR 3/1 or 4/1 or 2.5Y 4/1. Texture is loam, sandy clay loam, sandy loam, or fine sandy loam. The content of clay ranges from 12 to 27 percent. The content of gravel is 0 to 15 percent. Reaction is slightly acid or neutral.

The 2Cg horizon has dry color of 2.5Y 6/1 or 5/1. Moist color is 2.5Y 4/1 or 5/1. The horizon is sandy clay loam, loam, sandy loam, or the gravelly analogs of those textures. The content of clay ranges from 5 to 30 percent. The content of gravel is 0 to 35 percent. Reaction is slightly acid or neutral.

Galt Series

The Galt series consists of moderately deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in basins, drainageways, and swales on low terraces. Slope ranges from 0 to 2 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Aquic Durixererts

Typical Pedon

Galt clay, on a slope of 2 percent, under a cover of wild oat, filaree, ryegrass, and hayfield tarweed, at an elevation of 175 feet (53 m). When described on 5/18/89, the soil was dry to a depth of 24 inches (61 cm) and moist below that depth. (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); very dark grayish brown (10YR 3/2) clay, very dark grayish brown (10YR 3/2) moist; 45 percent clay; strong very fine subangular blocky structure; extremely hard, friable, very sticky, very plastic; many very fine and common fine roots; common very fine tubular pores; 2 percent mixed gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

A2—3 to 13 inches (8 to 33 cm); very dark grayish brown (10YR 3/2) clay, very dark grayish brown (10YR 3/2) moist; 50 percent clay; strong fine to coarse angular blocky structure; extremely hard, firm, very sticky, very plastic; many very fine and common fine roots; common very fine tubular pores; common discontinuous pressure faces; 2 percent mixed gravel; slightly alkaline, pH 7.5 by Hellige-Truog; gradual smooth boundary.

Bss—13 to 29 inches (33 to 74 cm); very dark grayish brown (10YR 3/2) clay, very dark grayish brown (10YR 3/2) moist; 55 percent clay; strong medium and coarse angular blocky structure; extremely hard, firm, very sticky, very plastic; common very fine roots; many very fine tubular pores; common intersecting slickensides; nearly continuous pressure faces; 2 percent mixed gravel; slightly alkaline, pH 7.5 by Hellige-Truog; gradual smooth boundary.

Bkss—29 to 32 inches (74 to 81 cm); dark brown (7.5YR 3/2) clay, dark brown (7.5YR 3/2) moist; 55 percent clay; moderate medium subangular blocky structure; extremely hard, firm, very sticky, very plastic; few very fine roots; many very fine tubular pores; common intersecting slickensides; common fine rounded soft lime masses; strongly effervescent (HCl, 1 normal); 2 percent mixed gravel; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

2Bkqm—32 to 39 inches (81 to 99 cm); indurated duripan; cemented by silica; carbonates in seams.

Type location: Butte County, California; about 0.3 mile east of Soto Lake, approximately 1,000 feet north and 3,100 feet west of the southwest corner of sec. 5,

T. 23 N. R. 1 W.; in an unsectionized area in the Bosquejo Land Grant; 39 degrees, 52 minutes, 20 seconds north latitude and 122 degrees, 1 minute, 21 seconds west longitude; NAD27; USGS Quad: Foster Island, California.

Range in Characteristics

Depth to the duripan ranges from 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from about late June to October (about 160 days). The particle-size control section averages 45 to 55 percent clay. Mineralogy is smectitic. Reversible, surface-initiated cracks 1.25 inches (3 cm) wide extend from the surface to the duripan. The depth to carbonates ranges from 0 to 32 inches (0 to 81 cm). A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through May. Rock fragments on the surface range from 0 to 10 percent gravel.

The A horizon has dry color of 10YR 3/2, 4/2, or 4/3. Moist color is 10YR 3/2, 3/3, 4/2, or 5/2 or 7.5YR 3/2, 3/3, or 4/2. Texture is clay, silty clay, gravelly clay, or clay loam. The content of clay ranges from 30 to 60 percent. The horizon has 0 to 25 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 1 to 2 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bss horizon has dry color of 10YR 3/2, 3/3, 4/2, or 4/3. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2, 3/3, 3/4, 4/2, or 4/4. Texture is clay, gravelly clay, cobbly clay, silty clay, or clay loam. The content of clay ranges from 38 to 60 percent. The horizon has 0 to 30 percent gravel and 0 to 15 percent cobbles. The content of organic matter is 0.2 to 0.8 percent. Reaction is neutral or slightly alkaline.

The Bkss horizon has dry color of 10YR 4/1 or 4/2 or 7.5YR 3/2. Moist color is 10YR 4/2 or 7.5YR 3/2, 4/2, 4/3, or 4/4. Texture is clay, gravelly clay, silty clay, or clay loam. The content of clay ranges from 37 to 60 percent. The content of gravel is 0 to 25 percent. The content of organic matter is 0.2 to 0.8 percent. Reaction ranges from neutral to moderately alkaline.

The Bw horizon, where it occurs, has dry color of 10YR 4/1 or 4/2 or 7.5YR 3/2. Moist color is 10YR 4/2 or 7.5YR 3/2, 4/2, 4/3, or 4/4. Texture is clay loam, sandy clay loam, loam, or sandy loam. The content of clay ranges from 15 to 37 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0.2 to 0.8 percent. Reaction is slightly alkaline.

Galt Taxadjunct

The Galt taxadjunct consists of moderately deep, somewhat poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in channels and swales on terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 16 inches (406 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Durixerepts

Typical Pedon

Galt taxadjunct clay loam, under a cover of annual grasses and tules, at an elevation of 54 feet (16 m). (Colors are for dry soil unless otherwise noted.)

Ak1—0 to 5 inches (0 to 13 cm); light brownish gray (10YR 6/2) clay loam, dark brown (10YR 3/3) moist; strong fine granular structure; hard, friable, sticky, plastic; many very fine and fine and few medium tubular pores; disseminated lime; 8 percent calcium carbonate equivalent; slightly effervescent; neutral; clear way boundary.

Ak2—5 to 13 inches (12 to 33 cm); pale brown (10YR 6/3) clay loam, dark brown (10YR 3/3) moist; strong medium subangular blocky structure; hard, friable,

sticky, plastic; common very fine roots; many very fine and fine and few medium tubular pores; disseminated lime; 8 percent calcium carbonate equivalent; slightly effervescent; moderately alkaline; clear smooth boundary.

Bk1—13 to 17 inches (33 to 43 cm); light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; strong medium subangular blocky structure; hard, friable, sticky, plastic; common very fine roots; many very fine and fine and few medium tubular pores; disseminated lime; 7 percent calcium carbonate equivalent; strongly effervescent; moderately alkaline; abrupt smooth boundary.

Bk2—17 to 21 inches (43 to 53 cm); very pale brown (10YR 7/3) clay loam, brown (10YR 5/3) moist; massive; hard, friable, slightly sticky, slightly plastic; common very fine roots; few very fine tubular pores; disseminated lime; 41 percent calcium carbonate equivalent; violently effervescent; moderately alkaline; abrupt smooth boundary.

2Bkqm—21 to 22 inches (53 to 56 cm); white (10YR 8/2) duripan, light brownish gray (10YR 6/2) moist; massive; extremely hard; continuous laminar bands of silica and calcium carbonate; alternating seams of lime; violently effervescent; abrupt smooth boundary.

2Bk—22 to 25 inches (56 to 64 cm); very pale brown (10YR 8/3) loam, very pale brown (10YR 7/3) moist; massive; slightly hard; very friable, nonsticky, nonplastic; disseminated lime; 43 percent calcium carbonate equivalent; violently effervescent; moderately alkaline; abrupt smooth boundary.

2B´kqm—25 to 26 inches (64 to 66 cm); white (10YR 8/2) duripan, light gray (10YR 7/2) moist; massive; extremely hard; continuous laminar bands of silica and calcium carbonate; alternating seams of lime; violently effervescent; abrupt smooth boundary.

3Cd—26 to 60 inches (66 to 152 cm); white (10YR 8/2) densic material, light olive brown (2.5Y 5/4) moist; massive; very hard, extremely firm; disseminated lime; violently effervescent.

Type location: Sutter County, California; about 4.7 miles west of Pennington, approximately 2,700 feet east and 350 feet south of the northwest corner of sec. 32, T. 17 N., R. 1 E.; 39 degrees, 17 minutes, 16 seconds north latitude and 121 degrees, 52 minutes, 53 seconds west longitude; NAD27; USGS Quad: Sanborn Slough, California.

Range in Characteristics

Depth to an indurated duripan ranges from 20 to 35 inches (51 to 89 cm). The mean annual soil temperature is 62 to 65 degrees F (17 to 18 degrees C). The particle-size control section ranges from 27 to 35 percent clay. Mineralogy is mixed. The soils are calcareous throughout. The content of organic matter is less than 1 percent throughout the profile. A fluctuating water table can occur from the top of the duripan to 12 inches (30 cm) below the surface of the soil from December through April.

The Ak horizon has dry color of 10YR 6/2 or 6/3. Moist color is 10YR 3/2, 3/3, or 4/3. Texture is clay loam. The content of clay ranges from 27 to 35 percent. Reaction ranges from neutral to moderately alkaline.

The Bk horizon has dry color of 10YR 6/2, 6/3, 7/3, or 6/4. Moist color is 10YR 5/3, 4/3, 4/4, 3/3, or 3/2. Texture is clay loam. The content of clay ranges from 27 to 35 percent. Reaction ranges from neutral to moderately alkaline.

The Galt taxadjunct is a taxadjunct because it has less clay than is described as the range for the series and because the duripan is underlain by dense silt deposits. These differences do not significantly affect the use, management, or interpretations of the soils.

Gianella Series

The Gianella series consists of very deep, moderately well drained soils that formed in overbank river alluvium derived from mixed rock sources. These soils are on flood plains within the meander belt. Slopes are 0 to 1 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C)

Taxonomic class: Coarse-loamy, mixed, superactive, nonacid, thermic Typic Xerofluvents

Typical Pedon

Gianella silt loam, on a slope of less than 1 percent, in a walnut orchard, at an elevation of 160 feet (49 m). When described on 10/27/1988, the soil was moist throughout (irrigated). The water table was at a depth of more than 80 inches (203 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); pale brown (10YR 6/3) silt loam, dark grayish brown (10YR 4/2) moist; 11 percent clay; weak thick platy structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular and common very fine irregular pores; slightly acid, pH 6.6 by pH meter 1:1 water; abrupt smooth boundary.

C1—2 to 8 inches (5 to 20 cm); grayish brown (10YR 5/2) loamy fine sand, very dark grayish brown (10YR 3/2) moist; 4 percent clay; single grain; loose, nonsticky, nonplastic; few very fine roots; common very fine interstitial and few very fine tubular pores; slightly acid, pH 6.6 by pH meter 1:1 water; clear smooth boundary.

C2—8 to 15 inches (20 to 38 cm); light yellowish brown (10YR 6/4) fine sandy loam, dark brown (10YR 3/3) moist; 8 percent clay; single grain; soft, very friable, slightly sticky, nonplastic; few medium roots; common very fine interstitial and few very fine tubular pores; neutral, pH 6.7 by pH meter 1:1 water; abrupt smooth boundary.

C3—15 to 22 inches (38 to 56 cm); light yellowish brown (10YR 6/4) very fine sandy loam, dark yellowish brown (10YR 3/4) moist; 6 percent clay; single grain; soft, very friable, nonsticky, nonplastic; few medium roots; common very fine interstitial and few very fine tubular pores; neutral, pH 6.7 by pH meter 1:1 water; clear smooth boundary.

C4—22 to 31 inches (56 to 79 cm); light brownish gray (2.5Y 6/2) very fine sandy loam, dark grayish brown (2.5Y 4/2) moist; 5 percent clay; single grain; soft, very friable, nonsticky, nonplastic; few medium roots; common very fine interstitial and few very fine tubular pores; neutral, pH 6.8 by pH meter 1:1 water; clear smooth boundary.

C5—31 to 41 inches (79 to 104 cm); pale brown (10YR 6/3) very fine sandy loam, brown (10YR 4/3) moist; 8 percent clay; single grain; soft, very friable, slightly sticky, slightly plastic; few medium and coarse roots; common very fine tubular pores; 2 percent fine faint very dark brown (10YR 2/2 moist) and grayish brown (10YR 5/2 dry) iron depletions; slightly acid, pH 6.6 by pH meter 1:1 water; clear smooth boundary.

C6—41 to 50 inches (104 to 127 cm); brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; 14 percent clay; massive; slightly hard, very friable, slightly sticky, slightly plastic; few fine and medium roots; common fine and medium tubular pores; 25 percent wormcasts; neutral, pH 6.7 by pH meter 1:1 water; clear smooth boundary.

C7—50 to 54 inches (127 to 137 cm); pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; 14 percent clay; massive; slightly hard, very friable, slightly sticky,

slightly plastic; few fine roots; common very fine and fine tubular pores; neutral, pH 6.8 by pH meter 1:1 water; clear smooth boundary.

C8—54 to 64 inches (137 to 163 cm); light yellowish brown (10YR 6/4) silt loam, brown (10YR 4/3) moist; 13 percent clay; massive; slightly hard, very friable, slightly sticky, slightly plastic; common fine and medium tubular pores; 1 percent fine prominent strong brown (7.5YR 5/6 moist) oxidized iron masses and 4 percent coarse distinct very dark gray (10YR 3/1 moist) iron depletions; neutral, pH 6.9 by pH meter 1:1 water; abrupt smooth boundary.

C9—64 to 66 inches (163 to 168 cm); light brownish gray (10YR 6/2) silt loam, brown (10YR 4/3) moist; 12 percent clay; massive; slightly hard, very friable, slightly sticky, slightly plastic; common fine tubular pores; neutral, pH 6.8 by pH meter 1:1 water; abrupt smooth boundary.

C10—66 to 69 inches (168 to 174 cm); light yellowish brown (10YR 6/4) loam, yellowish brown (10YR 5/4) moist; 10 percent clay; massive; slightly hard, very friable, slightly sticky, slightly plastic; common very fine and fine tubular pores; neutral, pH 7.1 by pH meter 1:1 water; abrupt smooth boundary.

C11—69 to 83 inches (174 to 210 cm); pale brown (10YR 6/3) loamy fine sand, brown (10YR 4/3) moist; 5 percent clay; single grain; loose, nonsticky, nonplastic; many very fine and fine interstitial pores; neutral, pH 7.1 by pH meter 1:1 water.

Type location: Butte County, California; about 5.7 miles northwest of Nord, on Snaden Island, approximately 2,700 feet west and 400 feet south of the west end of Bennett Road; in an unsectionized area in the Bosquejo Land Grant; T. 23 N., R. 2 W.; 39 degrees, 48 minutes, 13 seconds north latitude and 122 degrees, 3 minutes, 19 seconds west longitude; NAD27; USGS Quad: Foster Island, California.

Range in Characteristics

The soils are very deep and stratified. The mean annual soil temperature is 60 to 62 degrees F (16 to 17 degrees C). The particle-size control section averages 10 to 18 percent clay and has more than 15 percent fine sand or coarser sand. Mineralogy is mixed. The soils are noncalcareous throughout. The content of organic matter decreases irregularly with increasing depth. It ranges from 4.0 at the surface to 0.34 percent to a depth of 83 inches (211 cm). A fluctuating water table can occur at a depth of 33 to more than 80 inches (83 to 203 cm) from December through March. Redoximorphic features, such soft oxidized iron masses with color of 7.5YR 4/4 or 4/6 moist, may occur at a depth as high as 18 inches (46 cm). Also, they may occur in the A horizon, especially if the horizon has platy structure. Rock fragments on the surface range from 0 to 20 percent gravel. Some pedons have an Ab horizon, commonly with textures of silt loam or loam. Some pedons have a gravelly substratum.

The A and Ap horizons have dry color of 10YR 5/3, 6/3, or 5/4. Moist color is 10YR 3/2, 3/3, 4/2, or 4/3 or 2.5Y 3/3. Texture is silt loam, fine sandy loam, sandy loam, or loam. The content of clay ranges from 4 to 22 percent. Reaction ranges from moderately acid to moderately alkaline.

The C horizon has dry color of 10YR 5/2, 5/3, 5/4, 6/3, or 6/4 or 2.5Y 6/2. Moist color is 10YR 3/2, 4/2, 3/3, 3/4, 4/3, 4/4, or 5/2 or 2.5Y 4/2 or 4/3. Texture is loam, silt loam, fine sandy loam, very fine sandy loam, loamy sand, loamy fine sand, coarse sandy loam, sand, or sandy loam. The content of clay ranges from 1 to 15 percent. Reaction ranges from slightly acid to moderately alkaline.

Govstanford Series

The Govstanford series consists of very deep, somewhat poorly drained soils that formed in hydraulic mine sediment over basin clays. These soils are on flood plains and on alluvial fans above flood basins. Slopes are 0 to 1 percent. The mean annual

precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Coarse-loamy over clayey, mixed over smectitic, superactive, nonacid, thermic Oxyaquic Xerofluvents

Typical Pedon

Govstanford loam, on a slope of less than 1 percent, under a cover of almond trees, at an elevation of 139 feet (42 m). When described on 11/22/1993, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 3 inches (0 to 8 cm); pale brown (10YR 6/3) loam, dark brown (10YR 3/3) moist; 17 percent clay; moderate medium platy structure parting to moderate medium subangular and moderate fine granular; moderately hard, firm, nonsticky, slightly plastic; many very fine roots; few fine tubular pores; slightly acid, pH 6.5 pH by Hellige-Truog; clear smooth boundary.

Ap2—3 to 11 inches (8 to 28 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; 21 percent clay; weak fine subangular blocky structure; hard, very firm, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; few fine tubular pores; neutral, pH 6.8 by pH Hellige-Truog; clear wavy boundary.

C1—11 to 18 inches (28 to 46 cm); light yellowish brown (10YR 6/4) sandy loam, brown (10YR 4/3) moist; 5 percent clay; weak medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; many fine, common very fine and medium, and few coarse roots; few fine tubular and common fine interstitial pores; neutral, pH 7.0 pH by Hellige-Truog; clear smooth boundary.

C2—18 to 25 inches (46 to 64 cm); yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; 13 percent clay; weak medium subangular blocky structure; hard, very firm, nonsticky, nonplastic; few very fine and fine roots; common irregular tubular and irregular pores; slightly alkaline, pH 7.5 pH by Hellige-Truog; clear smooth boundary.

C3—25 to 34 inches (64 to 86 cm); yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; 9 percent clay; weak medium subangular blocky structure; hard, very firm, nonsticky, nonplastic; few very fine, fine, and coarse roots; common very fine and fine tubular pores; common fine distinct brown (7.5YR 4/4 moist) threadlike soft oxidized iron masses and common fine faint dark grayish brown (10YR 4/2 moist) irregularly shaped soft iron depletions; slightly alkaline, pH 7.5 pH by Hellige-Truog; abrupt smooth boundary.

2Assg—34 to 42 inches (86 to 107 cm); black (10YR 2/1) clay, black (10YR 2/1) moist; 56 percent clay; moderate fine subangular blocky structure; extremely hard, slightly rigid, very sticky, very plastic; few very fine and medium roots; few fine tubular pores; common intersecting slickensides; slightly alkaline, pH 7.5 pH by Hellige-Truog; clear smooth boundary.

2Bssg1—42 to 61 inches (107 to 155 cm); very dark gray (10YR 3/1) silty clay, very dark brown (10YR 2/2) moist; 56 percent clay; moderate medium subangular blocky structure; extremely hard, slightly rigid, very sticky, very plastic; few very fine and fine roots; few fine tubular pores; many intersecting slickensides; moderately alkaline, pH 8.0 pH by Hellige-Truog; clear smooth boundary.

2Bssg2—61 to 72 inches (155 to 183 cm); very dark grayish brown (10YR 3/2) silty clay, very dark grayish brown (10YR 3/2) moist; 52 percent clay; moderate medium subangular blocky structure; extremely hard, slightly rigid, very sticky, very plastic; few fine tubular pores; common intersecting slickensides; moderately alkaline, pH 8.0 pH by Hellige-Truog.

Type location: Butte County, California; about 2.3 miles south of Durham, approximately 200 feet north of where the old Sacramento Northern Railroad crossed Butte Creek and 100 feet west of the old tracks; in an unsectionized area in the

Esquon Land Grant; 39 degrees, 37 minutes, 0 seconds north latitude and 121 degrees, 46 minutes, 38 seconds west longitude; NAD27; USGS Quad: Nelson, California.

Range in Characteristics

Depth to the lithologic discontinuity is 20 to 36 inches (51 to 91 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The soil moisture control section is dry from June to October (120 to 150 days). The particle-size control section averages 4 to 17 percent clay in the coarse-loamy material and 40 to 60 percent clay in the clayey material. Mineralogy is mixed in the coarse-loamy material and smectitic in the clayey material. The content of organic matter is 1 to 2 percent to a depth of 11 inches (28 cm). Common or many intersecting slickensides occur in the 2Assg and 2Bssg horizons, from 34 to 72 inches (86 to 183 cm). A fluctuating water table can occur at a depth of 20 to 72 inches (51 to 183 cm) from December through April. In some pedons oxidized iron masses, iron-manganese concretions, and manganese masses occur in the underlying basin material.

The Ap horizon has dry color of 10YR 5/3, 6/2, or 6/3. Moist color is 10YR 3/3, 4/2, or 4/3. Texture is loam, fine sandy loam, or sandy loam. The content of clay ranges from 15 to 27 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the C horizon has dry color of 10YR 6/2, 6/3, 6/4, 7/2, or 7/3. Moist color is 10YR 4/2, 4/3, 4/4, 5/2, 5/3, or 5/4. Texture is sand, loamy sand, sandy loam, fine sandy loam, loam, or silt loam. The content of clay ranges from 3 to 18 percent. Reaction ranges from neutral to moderately alkaline.

The lower part of the C horizon has dry color of 10YR 6/2, 6/3, 6/4, 7/2, or 7/3. Moist color is 10YR 4/2, 4/3, 4/4, 5/2, 5/3, or 5/4. Texture is sand, loamy sand, sandy loam, fine sandy loam, loam, silt loam, or silt. The content of clay ranges from 5 to 18 percent. Redoximorphic features, such as oxidized iron masses with color of 7.5YR 3/4, 4/4, or 4/6 moist and iron depletions with color of 10YR 4/2 moist, occur in pores and on faces of peds in this part of the C horizon. Reaction ranges from neutral to moderately alkaline.

The 2Assg horizon has dry color of 10YR 2/1, 3/1, 4/1, 5/1, or 4/2. Moist color is 10YR 2/1, 3/1, 4/1, or 3/2. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. Reaction ranges from neutral to moderately alkaline.

The 2Bssg horizon has dry color of 10YR 2/2, 3/2, 4/1, 5/1, 5/2, or 6/2. Moist color is 10YR 3/1, 3/2, 4/1, or 4/2. Texture is silty clay, clay, or silty clay loam. The content of clay ranges from 35 to 55 percent. Reaction ranges from neutral to moderately alkaline.

Greenwell Series

The Greenwell series consists of moderately deep, well drained soils that formed in tephra over colluvium and residuum derived from volcanic mudflow. These soils are on lahar over narrow basalt plateaus in volcanic Sierra Nevada mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Medial, amorphic, frigid Humic Haploxerands

Typical Pedon

Greenwell medial sandy loam, on a northwest-facing slope of 17 percent, under a cover of mixed conifers and shrubs, at an elevation of 4,975 feet (1,516 m). When described on 12/16/1996, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed needles and twigs; abrupt smooth boundary.

Oe—2 to 3 inches (5 to 8 cm); moderately decomposed needles and twigs; abrupt smooth boundary.
A1—3 to 5 inches (8 to 13 cm); brown (10YR 5/3) medial sandy loam, dark brown (7.5YR 3/2) moist; 8 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few fine and common very fine roots; common very fine irregular and few very fine vesicular pores; 5 percent subrounded andesite gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 12.0; abrupt smooth boundary.
A2—5 to 10 inches (13 to 26 cm); brown (10YR 5/3) medial sandy loam, dark brown (10YR 3/3) moist; 10 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few fine and medium and common very fine roots; common very fine irregular pores; 10 percent subrounded andesite gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.7; abrupt smooth boundary.
Bw—10 to 18 inches (26 to 46 cm); light yellowish brown (10YR 6/4) gravelly medial sandy loam, dark brown (10YR 3/3) moist; 12 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many fine and medium, few coarse, and common very fine roots; common very fine irregular pores; 16 percent subrounded andesite gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.5; clear smooth boundary.
2BC1—18 to 23 inches (46 to 59 cm); very pale brown (10YR 7/3) medial sandy loam, brown (10YR 4/3) moist; 18 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine and medium and few coarse roots; common very fine irregular pores; 5 percent subrounded andesite cobbles; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 11.0; gradual wavy boundary.
2BC2—23 to 32 inches (59 to 82 cm); very pale brown (10YR 7/3) very gravelly medial sandy loam, brown (10YR 4/3) moist; 18 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few fine and common medium and coarse roots on top of the horizon; common very fine irregular pores; 5 percent subangular andesite cobbles and 40 percent subangular andesite gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.7; abrupt smooth boundary.
2Cr—32 inches (82 cm); moderately cemented volcanic mudflow bedrock imbedded with well rounded andesite gravel and cobbles; few fine roots in cracks more than 10 inches (25 cm) apart.

Type location: Plumas County, California; about 2.1 miles south of Camel Peak Lookout, approximately 2,050 feet west and 1,400 feet north of the southeast corner of sec. 8, T. 21 N., R. 8 E.; 39 degrees, 41 minutes, 18 seconds north latitude and 121 degrees, 6 minutes, 26 seconds west longitude; NAD83; USGS Quad: American House, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The particle-size control section averages 10 to 18 percent clay and 0 to 34 percent rock fragments, mostly gravel. Mineralogy is amorphic. The content of organic matter is 4 to 35 percent to a depth of 32 inches (81 cm). By ammonium acetate, base saturation ranges from 10 to 35 percent to a depth of 32 inches (81 cm). Rock fragments on the surface range from 0 to 5 percent gravel, 0 to 5 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 10YR 3/2, 3/3, 4/2, 5/2, or 5/3. Moist color is 10YR 2/1, 3/2, or 3/3 or 7.5YR 3/2. Texture is medial sandy loam or gravelly medial sandy

loam. The content of clay ranges from 8 to 11 percent. The content of gravel is 0 to 25 percent. NaF pH is 9 to 12. Reaction ranges from very strongly acid to slightly acid.

The Bw horizon has dry color of 10YR 4/3, 5/3, 6/3, or 6/4 or 7.5YR 4/2, 4/3, 5/3, or 6/3. Moist color is 10YR 3/3 or 4/3; 7.5YR 3/2, 3/3, or 4/2; or 5YR 3/2. Texture is medial sandy loam, gravelly medial sandy loam, or gravelly medial coarse sandy loam. The content of clay ranges from 10 to 15 percent. The horizon has 0 to 25 percent gravel and 0 to 5 percent cobbles. NaF pH is 11.0 to 11.5. Reaction ranges from very strongly acid to slightly acid.

The 2BC horizon has dry color of 10YR 5/4 or 7/3 or 7.5YR 4/3 or 6/3. Moist color is 10YR 4/3 or 7.5YR 3/3 or 4/3. Texture is medial sandy loam, gravelly medial sandy loam, very gravelly medial coarse sandy loam, or very gravelly medial sandy loam. The content of clay ranges from 12 to 18 percent. The horizon has 0 to 60 percent gravel and 0 to 10 percent cobbles. NaF pH is 10.5 to 11.0. Reaction is very strongly acid or strongly acid.

Gridley Series

The Gridley series consists of moderately deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on low terraces and basin rims. Slopes are 0 to 1 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Typic Argixerolls

Typical Pedon

Gridley clay loam, on a slope of less than 1 percent, in an irrigated prune orchard, at an elevation of 67 feet (21 m). When described on 4/5/1979, the soil was moist throughout. (Colors are for dry soil unless otherwise noted).

Ap—0 to 9 inches (0 to 23 cm); brown (10YR 5/3) clay loam, very dark grayish brown (10YR 3/2) moist; moderate fine and medium angular blocky structure; very hard, friable, sticky, plastic; common very fine and fine roots; common very fine and fine tubular pores; neutral, pH 7.0; clear smooth boundary.

A—9 to 19 inches (23 to 48 cm); brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; moderate medium angular blocky structure; very hard, friable, sticky, plastic; few very fine roots; common very fine tubular pores; slightly alkaline, pH 7.5; gradual wavy boundary.

Bt1—19 to 28 inches (48 to 71 cm); brown (10YR 5/3) clay, dark yellowish brown (10YR 3/4) moist; moderate coarse subangular blocky structure; extremely hard, firm, very sticky, very plastic; few very fine roots, common very fine and fine tubular pores; few thin clay films on faces of peds and in pores; slightly alkaline, pH 7.5; gradual wavy boundary.

Bt2—28 to 37 inches (71 to 94 cm); yellowish brown (10YR 5/4) clay, dark yellowish brown (10YR 3/4) moist; moderate coarse subangular blocky structure; extremely hard, firm, very sticky, very plastic; few very fine roots; common very fine and fine tubular pores; common pressure faces on peds; slightly alkaline, pH 7.5; clear wavy boundary.

2Cr—37 to 62 inches (94 to 157 cm); very pale brown (10YR 7/4) siltstone, yellowish brown (10YR 5/4) moist; common fine strong brown (7.5YR 4/6) oxidized iron masses lining pores; common moderately thick clay films on fracture faces; slightly alkaline, pH 7.5.

Type location: Sutter County, California; about 2.1 miles north of Yuba City, approximately 950 feet south and 250 feet east of the northeast corner of sec. 4, T. 15

N., R. 3 E.; in an unsectionized area in the New Helvetia Land Grant; 39 degrees, 11 minutes, 14 seconds north latitude and 121 degrees, 37 minutes, 59 seconds west longitude; NAD27; USGS Quad: Sutter, California.

Range in Characteristics

The depth to paralithic contact ranges from 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil temperature is above 47 degrees F (8 degrees C) the entire year. Unless irrigated, the soils are dry in all parts between depths of 6 and 17 inches (15 and 43 cm) from June through October and is moist in some or all parts from November through May. Reaction is neutral to moderately alkaline. Some pedons have a calcareous C horizon above the 2Cr horizon.

The A horizon has dry color of 10YR 5/3 or 5/2 or 7.5YR 5/2. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2. The content of clay ranges from 27 to 35 percent. Reaction ranges from neutral to moderately alkaline.

The Bt horizon has dry color of 10YR 6/3, 5/3, 6/4, or 5/4 or 7.5YR 6/4. Moist color is 10YR 3/2, 3/3, 3/4, 4/3, 4/4, or 5/4 or 7.5YR 3/2, 3/3, 4/4, or 4/6. Texture is clay loam, clay, or silty clay. The content of clay ranges from 35 to 55 percent.

Gridley Taxadjunct

The Gridley taxadjunct consists of moderately deep, somewhat poorly drained soils that formed alluvium derived from mixed rock sources. These soils are on terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Typic Durixerolls

Typical Pedon

Gridley taxadjunct clay loam, on a slope of 0 to 2 percent, under a cover of annual grasses and forbs, at an elevation of 70 feet (21 m). When described on 8/25/1988, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 4 inches (0 to 10 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 28 percent clay; moderate medium subangular blocky structure parting to weak medium granular; very hard, friable, moderately sticky, moderately plastic; few fine and common very fine roots; many very fine tubular pores; 10 percent fine dark yellowish brown (10YR 3/6 dry) iron-manganese masses throughout; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt1—4 to 9 inches (10 to 23 cm); dark grayish brown (10YR 4/2) clay loam, very dark grayish brown (10YR 3/2) moist; 38 percent clay; strong fine and medium angular blocky structure; extremely hard, firm, moderately sticky, moderately plastic; few fine and common very fine roots; many very fine tubular pores; 30 percent distinct clay films on faces of peds; 2 percent fine iron-manganese nodules and 10 percent very fine iron-manganese masses; 2 percent rounded gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bt2—9 to 15 inches (23 to 38 cm); brown (10YR 5/3) clay loam, very dark grayish brown (10YR 3/2) moist; 36 percent clay; strong fine and strong medium and coarse subangular blocky structure; extremely hard, firm, moderately sticky, moderately plastic; few very fine and fine roots; many very fine tubular pores; 10 percent slickensides; 21 percent prominent clay films on faces of peds and in pores; 2 percent fine iron-manganese nodules and 20 percent very fine iron-

manganese masses; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

Btk—15 to 21 inches (38 to 53 cm); pale brown (10YR 6/3) clay loam, dark brown (10YR 3/3) moist; 34 percent clay; moderate fine and medium subangular blocky structure; extremely hard, firm, moderately sticky, moderately plastic; few very fine and fine roots; many very fine tubular pores; 25 percent clay films; 1 percent very fine iron-manganese masses and 2 percent fine iron-manganese nodules; 2 percent medium spherical carbonate concretions; strong effervescence; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

2Bkqm—21 to 60 inches (53 to 152 cm); moderately cemented duripan; very pale brown (10YR 8/2) coarse sandy loam, pale brown (10YR 6/3) moist; 5 percent clay; massive; rigid, moderately cemented by silica, nonsticky, nonplastic; 10 percent very fine threadlike carbonate masses; strong effervescence; moderately alkaline, pH 8.0 by Hellige-Truog; indurated laminar capping, 3 mm thick, cemented by silica; violent effervescence on top of the capping.

Type location: Butte County, California; about 2.7 miles east of Graylodge Wildlife Area headquarters, approximately 1,200 feet west and 2,300 feet north of the southeast corner of sec. 18, T. 17 N., R. 2 E.; 39 degrees, 19 minutes, 28 seconds north latitude and 121 degrees, 47 minutes, 6 seconds west longitude; NAD27; USGS Quad: Pennington, California.

Range in Characteristics

Depth to the duripan ranges from 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from about May to October (about 150 days). The particle-size control section averages 35 to 40 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 3 percent to a depth of 9 inches (23 cm) and 0 to 1 percent from 9 to 20 inches (23 to 51 cm). The depth to carbonates ranges from 5 to 24 inches or more (13 to 61 cm). Electrical conductivity ranges from 0 to 2 mmhos/cm throughout the profile. Reversible, surface-initiated cracks 0.5 to 1 inch (1 to 2.5 cm) wide extend to a depth of 16 inches (41 cm) or more. A fluctuating water table can occur between the top of the duripan and 5 inches (13 cm) below the surface of the soil from December to April. Redoximorphic features, such as iron-manganese masses and iron-manganese nodules with color of N 2/0, 10YR 5/1, 5Y 5/1, or 5G 5/1, occur in all horizons.

The A horizon has dry color of 10YR 4/1, 4/2, 4/3, 5/1, 5/2, or 5/3 or 7.5YR 5/2. Moist color is 10YR 3/1, 3/2, or 3/3 or 7.5YR 3/2. Texture is loam or clay loam. The content of clay ranges from 25 to 30 percent. Reaction ranges from neutral to moderately alkaline.

The Bt horizon has dry color of 10YR 5/2, 5/3, 6/3, 5/4, 6/4, or 7/4 or 7.5YR 6/4. Moist color is 10YR 3/2, 3/3, 4/4, or 4/6. Texture is clay loam, silty clay loam, or clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 0 to 2 percent. Reaction ranges from neutral to moderately alkaline.

The Btk horizon has dry color of 10YR 6/3, 7/2, 7/3, or 8/2. Moist color is 10YR 3/3, 4/2, 4/3, 4/4, or 5/2. Texture is clay loam or clay. The content of clay ranges from 30 to 50 percent. Effervescence ranges from slight to strong. Reaction is slightly alkaline or moderately alkaline.

The 2Bkqm horizon has dry color of 10YR 6/2, 7/2, 7/3, 8/2, or 8/3. Moist color is 10YR 6/3, 6/6, or 7/3. Texture is coarse sandy loam, loam, or loamy coarse sand. The content of clay ranges from 5 to 20 percent. Rupture resistance ranges from indurated in the upper part of the horizon to weakly cemented or moderately cemented in the lower part. The indurated laminar cap is $^{1}/_{16}$ to $^{1}/_{4}$ inch (1 to 6 mm) thick.

The Gridley taxadjunct is a taxadjunct because it has a duripan rather than siltstone. This difference does not significantly affect the use, management, or interpretations of the soils.

Griffgulch Series

The Griffgulch series consists of deep, well drained soils that formed in residuum and colluvium derived from metavolcanic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 56 inches (1,422 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Clayey-skeletal, mixed, active, mesic Ultic Haploxeralfs

Typical Pedon

Griffgulch very gravelly silt loam, on a southwest-facing slope of 47 percent, under a cover of ponderosa pine, canyon live oak, whiteleaf manzanita, Pacific poison oak, buckbrush, and deerbrush, at an elevation of 2,460 feet (750 m). When described on 10/16/1997, the soil was dry to a depth of 33 inches (84 cm) and slightly moist from 33 to 58 inches (84 to 147 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); pine needles, twigs, and leaves.

Oe—2 to 3 inches (5 to 8 cm); partially decomposed pine needles, twigs, and leaves.

A—3 to 7 inches (8 to 18 cm); reddish yellow (7.5YR 6/6) very gravelly silt loam, reddish brown (5YR 4/4) moist; 26 percent clay; strong fine and medium granular structure; slightly hard, friable, nonsticky, slightly plastic; many very fine to medium roots; many very fine to coarse vesicular and tubular pores; noneffervescent; 35 percent gravel and 15 percent cobbles; moderately acid, pH 5.9 by pH meter 1:1 water; gradual smooth boundary.

Bt1—7 to 11 inches (18 to 28 cm); reddish yellow (7.5YR 6/6) very cobbly silty clay loam, reddish brown (5YR 4/4) moist; 27 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; many very fine to medium roots; many very fine to medium and few coarse vesicular and tubular pores; few faint discontinuous clay films on faces of peds; noneffervescent; 20 percent gravel and 20 percent cobbles; moderately acid, pH 5.9 by pH meter 1:1 water; gradual smooth boundary.

Bt2—11 to 20 inches (28 to 51 cm); reddish yellow (5YR 6/6) extremely cobbly silty clay loam, yellowish red (5YR 4/6) moist; 32 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine to coarse roots; many very fine and common fine and medium vesicular and tubular pores; common distinct continuous clay films on faces of peds; noneffervescent; 30 percent gravel, 30 percent cobbles, and 10 percent stones; moderately acid, pH 6.0 by pH meter 1:1 water; gradual smooth boundary.

Bt3—20 to 33 inches (51 to 84 cm); reddish yellow (5YR 6/6) very cobbly silty clay, yellowish red (5YR 4/6) moist; 41 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; many very fine and fine and common medium vesicular and tubular pores; many prominent continuous clay films on faces of peds; noneffervescent; 15 percent gravel, 30 percent cobbles, and 10 percent stones; moderately acid, pH 5.9 by pH meter 1:1 water; gradual smooth boundary.

Bt4—33 to 47 inches (84 to 119 cm); reddish yellow (5YR 6/6) very cobbly clay, yellowish red (5YR 4/6) moist; 46 percent clay; moderate medium subangular blocky structure; slightly hard, friable, very sticky, very plastic; common very fine to coarse roots; many very fine and fine and common medium tubular pores; many prominent continuous clay films on faces of peds; noneffervescent; 15

percent gravel, 15 percent cobbles, and 10 percent stones; moderately acid, pH 5.9 by pH meter 1:1 water; clear smooth boundary.

Bt5—47 to 58 inches (119 to 147 cm); reddish yellow (5YR 6/6) extremely gravelly clay, yellowish red (5YR 4/6) moist; 46 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; common very fine to medium tubular pores; many prominent continuous clay films on faces of peds; noneffervescent; 30 percent gravel, 20 percent cobbles, and 20 percent stones; moderately acid, pH 6.0 by pH meter 1:1 water; abrupt wavy boundary.

R—58 inches (147 cm); very strongly cemented metavolcanic bedrock.

Type location: Butte County, California; about 1.5 miles south-southeast of Sawmill Peak, approximately 2,150 feet north and 2,050 feet west of the southeast corner of sec. 5, T. 22 N., R. 4 E.; 39 degrees, 47 minutes, 27.1 seconds north latitude and 121 degrees, 33 minutes, 3.1 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 53 to 59 degrees F (12 to 15 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 35 to 45 percent clay and 35 to 70 percent rock fragments. Mineralogy is mixed. Rock fragments on the surface range from 10 to 30 percent gravel, 0 to 20 percent cobbles, 0 to 15 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 5YR 5/4, 6/4, or 7/4 or 7.5YR 6/6 or 6/4. Moist color is 5YR 3/3, 4/3, or 4/4. The horizon is silt loam, loam, or the gravelly or very gravelly analogs of those textures. The content of clay ranges from 18 to 27 percent. The horizon has 10 to 45 percent gravel, 0 to 25 percent cobbles, and 0 to 15 percent stones. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 2.5YR 5/6 or 6/6, 5YR 6/6 or 7/6, or 7.5YR 6/6. Moist color is 2.5YR 4/6 or 5YR 4/3, 4/4, or 4/6. Texture is gravelly clay loam, very cobbly clay loam, very cobbly silty clay loam, or extremely cobbly silty clay loam. The content of clay ranges from 27 to 35 percent. The content of gravel is 15 to 35 percent, the content of cobbles is 5 to 35 percent, and the content of stones is 0 to 15 percent. Reaction is moderately acid or slightly acid.

The lower part of the Bt horizon has dry color of 2.5YR 5/6 or 6/6 or 5YR 6/6, 6/8, or 7/6. Moist color is 2.5YR 4/6 or 5YR 4/6, 5/6, 5/8, or 6/8. Texture is very gravelly clay loam, cobbly clay loam, very cobbly clay loam, extremely gravelly clay, very cobbly clay, or very cobbly silty clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 15 to 35 percent, the content of cobbles is 10 to 40 percent, and the content of stones is 10 to 20 percent. Reaction is moderately acid or slightly acid.

Hamslough Series

The Hamslough series consists of moderately deep, poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in channels on low stream terraces and strath terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Clayey-skeletal, smectitic, thermic Typic Petraquepts

Typical Pedon

Hamslough clay, on a south-facing slope of less than 1 percent, under a cover of ryegrass, spike rush, and coyote thistle, at an elevation of 191 feet (58 m). When

described on 4/10/2000, the soil was slightly moist to a depth of 3 inches (8 cm) and moist from 3 to 55 inches (8 to 140 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); dark gray (7.5YR 4/1) clay, dark brown (7.5YR 3/2) moist; 50 percent clay; moderate medium and coarse subangular blocky structure; very hard, friable, very sticky, very plastic; many very fine roots; few very fine and fine tubular and irregular pores; 20 percent fine threadlike strong brown (7.5YR 5/6) oxidized iron masses on surfaces along root channels; 5 percent gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

A2—3 to 14 inches (8 to 36 cm); dark gray (7.5YR 4/1) cobbly clay, brown (7.5YR 4/2) moist; 50 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine roots; few very fine and fine tubular pores; 10 percent gravel and 15 percent cobbles; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt smooth boundary.

Bw—14 to 19 inches (36 to 48 cm); light brown (7.5YR 6/3) extremely gravelly clay, brown (7.5YR 5/3) moist; 50 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine roots; few very fine and fine tubular pores; 15 percent cobbles and 50 percent gravel; slightly alkaline, pH 7.8 by Hellige-Truog; gradual smooth boundary.

Bg—19 to 27 inches (48 to 69 cm); light brownish gray (2.5Y 6/2) extremely gravelly sandy clay, grayish brown (2.5Y 5/2) moist; 50 percent clay; weak fine subangular blocky structure; very hard, friable, very sticky, very plastic; few very fine roots; few very fine and fine tubular pores; 15 percent medium irregular brown (7.5YR 5/4) oxidized iron masses in the matrix; 20 percent cobbles and 50 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

2Bqm—27 to 55 inches (69 to 140 cm); reddish yellow (7.5YR 7/6), strongly cemented duripan, brown (7.5YR 5/4) moist; massive; extremely hard, firm, strongly cemented by silica; few very fine and fine tubular and irregular pores; strongly alkaline, pH 8.5 by Hellige-Truog.

Type location: Butte County, California; about 1.7 miles south of the Neal Road Landfill, approximately 100 feet north and 1,750 feet west of the southeast corner of sec. 23, T. 21 N., R. 2 E.; 39 degrees, 39 minutes, 16 seconds north latitude and 121 degrees, 43 minutes, 6 seconds west longitude; NAD83; USGS Quad: Hamlin Canyon, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The particle-size control section averages 45 to 55 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is smectitic. Reversible, surface-initiated cracks 0.25 to 1 inch (0.6 to 3 cm) wide extend to a depth of 14 inches (36 cm) from 150 to 180 days when the soils are not irrigated. A fluctuating water table can occur between a depth of 60 inches (152 cm) and the surface of the soil from December through May. Redoximorphic features, such as soft oxidized iron masses with color of 7.5YR 5/4 or 5/6, occur throughout the profile. Rock fragments on the surface range from 0 to 20 percent gravel and 0 to 25 percent cobbles. Some pedons have a Bss horizon.

The A horizon has dry color of 7.5YR 4/1, 4/2, or 5/2 or 10YR 5/1. Moist color is 7.5YR 3/2 or 4/2 or 10YR 4/1. Texture is clay, gravelly clay, or cobbly clay. The content of clay ranges from 40 to 60 percent. The horizon has 5 to 15 percent gravel and 0 to 15 percent cobbles. Reaction is neutral or slightly alkaline.

The Bw horizon has dry color of 7.5YR 5/2, 6/3, or 7/4 or 10YR 4/1. Moist color is 7.5YR 4/2, 4/3, 5/3, or 5/4 or 10YR 4/1. Texture is clay, gravelly clay, very gravelly clay, or extremely gravelly clay. The content of clay ranges from 40 to 60 percent. The

horizon has 10 to 50 percent gravel and 0 to 25 percent cobbles. Reaction is slightly alkaline or moderately alkaline.

The Bg horizon has dry color of 2.5Y 6/2 or 10YR 4/1. Moist color is 2.5Y 5/2 or 10YR 4/1. Texture is extremely gravelly clay, extremely gravelly sandy clay, cobbly clay, or very gravelly sandy clay loam. The content of clay ranges from 30 to 60 percent. The horizon has 20 to 50 percent gravel and 15 to 25 percent cobbles. Reaction is moderately alkaline or strongly alkaline.

Haplic Palexeralfs

Haplic Palexeralfs consist of very deep, moderately well drained soils that formed in alluvium derived from basalt and mixed sediments. These soils are on low stream terraces. Slopes range from 0 to 5 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Haplic Palexeralfs

Typical Pedon

Haplic Palexeralfs, on a west-facing slope of 5 percent, under a cover of annual grasses, forbs, and scattered willow and valley oak, at an elevation of 380 feet (115 m). When described on 6/3/2001, the soil was dry to a depth of 45 inches (114 cm) and slightly moist from 45 to 64 inches (114 to 163 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (10YR 5/3) loam, very dark grayish brown (10YR 3/2) moist; 18 percent clay; moderate fine subangular blocky structure parting to moderate fine granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine roots; many fine irregular pores; 10 percent subrounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bt1—3 to 9 inches (8 to 23 cm); brown (10YR 5/3) very gravelly loam, very dark grayish brown (10YR 3/2) moist; 22 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, slightly plastic; many very fine and fine and common medium roots; common fine and medium irregular pores; 10 percent discontinuous faint clay films on surfaces along pores; 10 percent subrounded basalt cobbles and 25 percent subrounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bt2—9 to 22 inches (23 to 56 cm); brown (10YR 5/3) very gravelly clay loam, brown (7.5YR 4/2) moist; 30 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common medium and coarse roots; common fine and medium tubular pores; 15 percent discontinuous faint clay films on surfaces along pores; 10 percent subrounded basalt cobbles and 35 percent subrounded basalt gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

2Bt3—22 to 31 inches (56 to 79 cm); pale brown (10YR 6/3) extremely gravelly sandy clay, brown (7.5YR 4/2) moist; 38 percent clay; moderate medium subangular blocky structure; very hard, firm, moderately sticky, moderately plastic; common medium roots; common fine tubular pores; 15 percent discontinuous faint clay films on surfaces along pores; 20 percent subrounded basalt cobbles and 45 percent subrounded basalt gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

2Bt4—31 to 45 inches (79 to 114 cm); yellowish brown (10YR 5/4) extremely gravelly sandy clay loam, brown (7.5YR 4/3) moist; 35 percent clay; moderate coarse subangular blocky structure; very hard, very firm, moderately sticky, moderately plastic; few medium roots; common fine tubular pores; 15 percent discontinuous

distinct clay films on surfaces along pores; 15 percent subrounded basalt cobbles, 25 percent subrounded basalt gravel, and 25 percent subrounded basalt stones; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

2Bt5—45 to 52 inches (114 to 132 cm); brown (10YR 5/3) extremely gravelly sandy clay, brown (7.5YR 4/3) moist; 39 percent clay; moderate medium subangular blocky structure; hard, firm, very sticky, moderately plastic; few fine and medium roots; common fine tubular pores; 50 percent discontinuous prominent clay films on surfaces along pores; 2 percent fine irregular brown (7.5YR 4/4 dry) oxidized iron masses and 10 percent fine irregular black (N 2/0 dry) manganese masses; 10 percent subrounded basalt cobbles, 15 percent subrounded basalt stones, and 35 percent subrounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

3Bt6—52 to 64 inches (132 to 163 cm); brown (10YR 5/3) extremely cobbly sandy clay, brown (7.5YR 4/3) moist; 42 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, very sticky, moderately plastic; few fine roots; common fine irregular pores; 60 percent discontinuous prominent clay films on surfaces along pores; 5 percent fine irregular black (N 2/0 dry) manganese masses and 5 percent fine irregular brown (7.5YR 4/4 dry) oxidized iron masses; 20 percent subrounded basalt stones, 25 percent subrounded basalt gravel, and 35 percent subrounded basalt cobbles; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 3.4 miles northwest of Oroville; adjacent to Little Cottonwood Creek, in Schrimer Ravine, approximately 300 feet west and 2,950 feet north of the southeast corner of sec. 25, T. 20 N., R. 3 E.; 39 degrees, 33 minutes, 39 seconds north latitude and 121 degrees, 34 minutes, 39 seconds west longitude; NAD27; USGS Quad: Oroville, California.

Range in Characteristics

Depth to an extremely weakly cemented duripan is 60 to 80 inches (152 to 203 cm) or more. The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 22 to 30 percent clay and 35 to 50 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur at a depth of 60 to 80 inches (152 to 203 cm) or more from December through April. Rock fragments on the surface range from 0 to 10 percent gravel and 5 to 50 percent cobbles.

The A horizon has dry color of 10YR 4/3 or 5/3. Moist color is 10YR 3/2 or 3/3. Texture is loam, gravelly fine sandy loam, gravelly loam, very gravelly loam, or very gravelly fine sandy loam. The content of clay ranges from 15 to 18 percent. The horizon has 10 to 40 percent gravel and 0 to 10 percent cobbles. The content of organic matter is 2 to 4 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 10YR 5/3, 5/4, or 6/3. Moist color is 10YR 3/2, 3/3, or 4/3 or 7.5YR 4/2. Texture is very gravelly loam, very gravelly sandy clay loam, very gravelly clay loam, or extremely gravelly sandy clay loam. The content of clay ranges from 22 to 30 percent. The horizon has 25 to 65 percent gravel and 5 to 20 percent cobbles. The content of organic matter is 0.5 to 2 percent. Reaction is moderately acid or slightly acid.

The 2Bt horizon has dry color of 10YR 4/3, 5/3, 5/4, or 6/3 or 7.5YR 6/3. Moist color is 10YR 3/4 or 4/4 or 7.5YR 4/2, 4/3, or 5/4. Texture is extremely gravelly sandy clay, very cobbly sandy clay loam, extremely gravelly sandy clay loam, extremely cobbly sandy clay loam, or extremely cobbly sandy clay. The content of clay ranges from 25 to 40 percent. The horizon has 35 to 55 percent gravel, 10 to 40 percent cobbles, and 0 to 25 percent stones. The content of organic matter is 0.5 to 1 percent. Redoximorphic features range from 0 to 2 percent oxidized iron masses and 2 to 10 percent manganese masses. Reaction is slightly acid.

The 3Bt horizon has dry color of 10YR 4/3 or 5/3 or 7.5YR 6/4. Moist color is 10YR 3/3 or 7.5YR 4/3 or 5/4. Texture is extremely gravelly sandy clay, extremely gravelly clay, extremely cobbly sandy clay, or extremely cobbly clay. The content of clay ranges from 40 to 50 percent. The horizon has 25 to 50 percent gravel, 30 to 40 percent cobbles, and 0 to 20 percent stones. The content of organic matter is 0.2 to 0.8 percent. Redoximorphic features range from 0 to 5 percent oxidized iron masses and 5 to 10 percent oxidized manganese masses. Reaction is neutral.

Haploxeralfs

Haploxeralfs consist of moderately deep or deep, well drained soils that formed in colluvium derived from metavolcanic and metasedimentary rocks. These soils are on backslopes in canyons on Sierra Nevada foothills. Slopes range from 70 to 110 percent. The mean annual precipitation is about 62 inches (1,575 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, thermic Ultic Haploxeralfs

Typical Pedon

Haploxeralfs, on a west-facing slope of 80 percent, under a cover of shrub interior live oak, Pacific poison oak, toyon, whiteleaf manzanita, and canyon live oak, at an elevation of 1,400 feet (427 m). When described on 6/30/1998, the soil was dry to a depth of 22 inches (56 cm) and slightly moist from 22 to 47 inches (56 to 119 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); slightly decomposed plant material; abrupt smooth boundary.

A—0.5 inch to 4 inches (1 to 10 cm); very pale brown (10YR 7/3) very gravelly loam, brown (7.5YR 4/3) moist; 26 percent clay; strong fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, slightly plastic; many very fine and fine roots; many very fine to medium irregular and tubular and few coarse tubular pores; 10 percent cobbles and 35 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; clear smooth boundary.

Bt1—4 to 9 inches (10 to 23 cm); very pale brown (10YR 7/4) very gravelly clay loam, brown (7.5YR 4/3) moist; 29 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, slightly plastic; common very fine to coarse roots; many very fine to coarse tubular and irregular pores; 80 percent continuous faint clay films; 20 percent cobbles and 40 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.

Bt2—9 to 13 inches (23 to 33 cm); very pale brown (10YR 7/4) very gravelly clay loam, brown (7.5YR 4/3) moist; 32 percent clay; moderate fine subangular blocky structure; moderately hard, friable, moderately sticky, slightly plastic; common very fine to coarse roots; many very fine to coarse tubular and irregular pores; 80 percent continuous faint clay films; 10 percent cobbles and 45 percent gravel; moderately acid, pH 6.1 by Hellige-Truog; clear smooth boundary.

Bt3—13 to 22 inches (33 to 56 cm); very pale brown (10YR 7/4) extremely gravelly clay loam, brown (7.5YR 4/4) moist; 34 percent clay; moderate fine subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; many very fine to coarse irregular and tubular pores; 80 percent continuous faint clay films; 5 percent stones, 35 percent cobbles, and 40 percent gravel; moderately acid, pH 6.1 by Hellige-Truog; clear smooth boundary.

Bt4—22 to 31 inches (56 to 79 cm); very pale brown (10YR 7/4) extremely gravelly clay loam, strong brown (7.5YR 4/6) moist; 35 percent clay; moderate fine

subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; many very fine to coarse tubular and irregular pores; 80 percent continuous faint clay films; 10 percent stones, 25 percent cobbles, and 30 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; gradual smooth boundary.

Bt5—31 to 47 inches (79 to 119 cm); very pale brown (10YR 7/4) extremely gravelly clay loam, strong brown (7.5YR 4/6) moist; 36 percent clay; moderate fine subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to coarse tubular and irregular pores; 80 percent continuous faint clay films; 15 percent stones, 30 percent cobbles, and 40 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt irregular boundary.

R—47 inches (119 cm); indurated metavolcanic bedrock.

Type location: Butte County, California; about 1.1 miles south of Bear Lake, approximately 350 feet south and 2,200 feet east of the northwest corner of sec. 31, T. 24 N., R. 3 E.; 39 degrees, 54 minutes, 8 seconds north latitude and 121 degrees, 41 minutes, 13 seconds west longitude; NAD83; USGS Quad: Cohasset, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 60 inches (51 to 152 cm). The mean annual soil temperature is 59 to 69 degrees F (15 to 21 degrees C). The soil moisture control section is dry in all parts from about June to November (about 150 days). The particle-size control section averages 18 to 35 percent clay and 35 to 80 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 15 to 50 percent gravel, 5 to 25 percent cobbles, 0 to 20 percent stones, and 0 to 20 percent boulders.

The A horizon has dry color of 10YR 6/3 or 7/3, 7.5YR 6/3 or 7/3, or 5YR 5/4 or 6/4. Moist color is 7.5YR 4/2 or 4/3 or 5YR 3/3. Texture is loam, gravelly loam, very gravelly loam, or gravelly sandy loam. The content of clay ranges from 17 to 27 percent. The horizon has 10 to 50 percent gravel, 0 to 15 percent cobbles, 0 to 15 percent stones, and 0 to 15 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 6/4 or 7/4; 7.5YR 5/4, 6/4, 7/4, or 6/3; or 5YR 5/4, 5/6, or 6/6. Moist color is 7.5YR 4/3, 4/4, 4/6, or 5/4 or 5YR 3/4, 4/4, or 4/6. Texture is gravelly loam, very gravelly loam, very cobbly loam, gravelly clay loam, very gravelly clay loam, or extremely gravelly clay loam. The content of clay ranges from 20 to 40 percent. The horizon has 15 to 50 percent gravel, 0 to 35 percent cobbles, 0 to 20 percent stones, and 0 to 20 percent boulders. Reaction ranges from strongly acid to neutral.

Haploxeralfs, Terrace

Haploxeralfs, terrace, consist of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on stream terraces on the bottom of canyons on Cascade foothills. Slopes range from 0 to 8 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Haploxeralfs

Typical Pedon

Haploxeralfs, terrace, on a northeast-facing slope of 1 percent, under a cover of yellow starthistle and soft chess, at an elevation of 920 feet (280 m). When described on 10/5/1998, the soil was very slightly moist to a depth of 5 inches (13 cm) and dry below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 5 inches (0 to 13 cm); yellowish brown (10YR 5/4) gravelly loam, brown (10YR 4/3) moist; 22 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; many very fine roots; common very fine and fine and few medium tubular and irregular pores; 5 percent cobbles and 25 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt1—5 to 11 inches (13 to 28 cm); yellowish brown (10YR 5/4) gravelly loam, brown (7.5YR 4/3) moist; 24 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine and fine and common medium tubular pores; 40 percent discontinuous distinct clay films; 5 percent cobbles, 5 percent stones, and 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; diffuse smooth boundary.

Bt2—11 to 18 inches (28 to 46 cm); brown (7.5YR 5/4) very gravelly loam, brown (7.5YR 4/3) moist; 27 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine and fine roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 5 percent stones, 10 percent cobbles, and 20 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; diffuse smooth boundary.

Bt3—18 to 32 inches (46 to 81 cm); brown (7.5YR 5/4) very cobbly clay loam, brown (7.5YR 4/4) moist; 34 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 90 percent continuous distinct clay films; 10 percent stones, 10 percent boulders, 20 percent cobbles, and 20 percent gravel; neutral, pH 6.7 by Hellige-Truog; diffuse smooth boundary.

Bt4—32 to 48 inches (81 to 122 cm); brown (7.5YR 5/4) extremely cobbly clay loam, brown (7.5YR 4/4) moist; 31 percent clay; moderate fine subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; 90 percent continuous distinct clay films; 15 percent boulders, 20 percent gravel, 20 percent stones, and 30 percent cobbles; neutral, pH 6.8 by Hellige-Truog; diffuse smooth boundary.

Bt5—48 to 63 inches (122 to 160 cm); brown (7.5YR 5/4) extremely cobbly sandy clay loam, brown (7.5YR 4/4) moist; 27 percent clay; moderate fine subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; many very fine and fine tubular pores; 90 percent continuous distinct clay films; 15 percent boulders, 20 percent stones, 20 percent gravel, and 30 percent cobbles; neutral, pH 6.9 by Hellige-Truog.

Type location: Butte County, California; about 1.7 miles southwest of Forest Ranch, approximately 1,400 feet north and 1,250 feet east of the southwest corner of sec. 12, T. 23 N., R. 2 E.; 39 degrees, 51 minutes, 44 seconds north latitude and 121 degrees, 42 minutes, 34 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 59 to 62 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 days). The particle-size control section averages 20 to 35 percent clay and 15 to 60 percent rock fragments, mostly cobbles. Mineralogy is mixed. Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 15 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 10YR 5/2, 5/3, 5/4, or 6/4. Moist color is 10YR 3/2, 4/2, or 4/3 or 7.5YR 4/2. Texture is loam, gravelly loam, or fine sandy loam. The content of clay ranges from 15 to 26 percent. The horizon has 3 to 30 percent gravel,

0 to 5 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 5/3, 5/4, 6/3, or 6/4 or 7.5YR 5/4 or 6/4. Moist color is 10YR 4/3 or 4/4 or 7.5YR 3/4, 4/3, or 4/4. Texture is loam, gravelly loam, very gravelly loam, sandy clay loam, extremely gravelly sandy clay loam, extremely cobbly sandy clay, loam, clay loam, very cobbly clay loam, or extremely cobbly clay loam. The content of clay ranges from 18 to 35 percent. The horizon has 5 to 40 percent gravel, 0 to 30 percent cobbles, 0 to 25 percent stones, and 0 to 20 percent boulders. Reaction ranges from moderately acid to neutral.

Haploxerands

Haploxerands consist of moderately deep to very deep, well drained soils that formed in glacial outwash derived from granitic and volcanic rocks. These soils are on alluvial flats in Cascade and Sierra Nevada mountain valleys. Slopes range from 0 to 15 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Haploxerands

Typical Pedon

Haploxerands, on an east-northeast-facing slope of 15 percent, under a cover of white fir, sugar pine, and red fir, at an elevation of 4,280 feet (1,305 m). When described on 7/19/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); slightly decomposed plant material; abrupt smooth boundary.

A1—0.5 inch to 2 inches (1 to 5 cm); pale brown (10YR 6/3) medial sandy loam, brown (10YR 4/3) moist; 5 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine and fine tubular and irregular pores; 10 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.5; clear smooth boundary.

A2—2 to 5 inches (5 to 13 cm); pale brown (10YR 6/3) gravelly medial sandy loam, brown (10YR 4/3) moist; 3 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine and fine tubular and irregular pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 11.0; gradual smooth boundary.

Bw1—5 to 12 inches (13 to 30 cm); pale brown (10YR 6/3) medial sandy loam, brown (10YR 4/3) moist; 3 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine to coarse roots; many very fine and fine tubular and irregular pores; 10 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 11.0; gradual smooth boundary.

Bw2—12 to 23 inches (30 to 58 cm); pale brown (10YR 6/3) gravelly medial sandy loam, brown (10YR 4/3) moist; 2 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine to medium and common coarse roots; many very fine and fine tubular and irregular pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 11.0; gradual smooth boundary.

Bw3—23 to 30 inches (58 to 76 cm); very pale brown (10YR 7/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; 2 percent clay; weak fine and medium subangular blocky structure parting to single grain; soft, very friable, nonsticky, nonplastic; many very fine and fine and common medium and coarse roots; many very fine and fine tubular and irregular pores; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 11.0; diffuse smooth boundary.

Bw4—30 to 42 inches (76 to 107 cm); very pale brown (10YR 7/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; 2 percent clay; weak fine and medium subangular blocky structure parting to single grain; soft, very friable, nonsticky, nonplastic; common very fine to medium roots; many very fine and fine tubular and irregular pores; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; diffuse smooth boundary.

Bw5—42 to 60 inches (107 to 152 cm); very pale brown (10YR 7/3) gravelly coarse sandy loam, brown (10YR 4/3) moist; 2 percent clay; weak fine and medium subangular blocky structure parting to single grain; soft, very friable, nonsticky, nonplastic; common very fine to medium roots; many very fine and fine tubular and irregular pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; diffuse smooth boundary.

Bw6—60 to 80 inches (152 to 203 cm); very pale brown (10YR 7/3) coarse sandy loam, brown (10YR 4/3) moist; 2 percent clay; weak fine and medium subangular blocky structure parting to single grain; soft, very friable, nonsticky, nonplastic; common very fine to medium roots; many very fine and fine irregular and tubular pores; 10 percent gravel; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Plumas County, California; about 0.63 mile southwest of Campbell Cow Camp, approximately 200 feet south and 850 feet east of the northwest corner of sec. 23, T. 24 N, R. 5 E.; 39 degrees, 55 minutes, 44 seconds north latitude and 121 degrees, 23 minutes, 16 seconds west longitude; NAD27; USGS Quad: Kimshew Point, California.

Range in Characteristics

The depth to bedrock is 20 to more than 80 inches (51 to 203 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The soil moisture control section is dry in all parts from about July to October (about 120 days). The particle-size control section averages 2 to 20 percent clay and 5 to 35 percent rock fragments, mostly gravel. NaF pH is 9.8 to 11 to a depth of 40 inches (102 cm). Rock fragments on the surface range from 5 to 35 percent gravel, 0 to 15 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 10YR 5/2, 5/3, 6/2, or 6/3 or 7.5YR 6/4. Moist color is 10YR 3/2 or 4/3 or 7.5YR 4/3. Texture is medial sandy loam, gravelly medial sandy loam, medial coarse sandy loam, or gravelly medial coarse sandy loam. The content of clay ranges from 3 to 18 percent. The content of gravel is 5 to 25 percent. Reaction is moderately acid or slightly acid.

The Bw horizon has dry color of 10YR 5/3, 6/3, 7/3, or 8/6 or 7.5YR 6/4, 7/6, or 8/4. Moist color is 10YR 3/2, 4/2, 4/3, or 5/3 or 7.5YR 4/4, 5/6, or 5/8. Texture is sandy loam, gravelly sandy loam, coarse sandy loam, gravelly coarse sandy loam, or gravelly loamy coarse sand. The content of clay ranges from 1 to 20 percent. The content of gravel is 2 to 35 percent. Reaction ranges from very strongly acid to slightly acid.

Haploxerands, Granitic Till

Haploxerands, granitic till, consist of moderately deep to very deep, moderately well drained or well drained soils that formed in glacial till derived from quartz diorite, andesite, and basalt. These soils are on moraines in the Sierra Nevada Mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 82 inches (2,083 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Frigid Typic Haploxerands

Typical Pedon

Haploxerands, granitic till, on a southeast-facing slope of 14 percent, under a cover of white fir, sugar pine, incense cedar, California black oak, ponderosa pine, red fir, and shrubs, at an elevation of 4,945 feet (1,507 m). When described on 7/13/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed plant material; abrupt smooth boundary.

A1—2 to 5 inches (5 to 13 cm); brown (10YR 5/3) medial sandy loam, very dark grayish brown (10YR 3/2) moist; 5 percent clay; weak fine and medium subangular blocky structure; loose, nonsticky, nonplastic; many very fine and fine and common medium roots; many very fine and fine and common medium irregular and tubular pores; 5 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 11.5; gradual smooth boundary.

A2—5 to 12 inches (13 to 30 cm); brown (10YR 5/3) medial sandy loam, dark grayish brown (10YR 4/2) moist; 4 percent clay; weak fine and medium subangular blocky structure; loose, nonsticky, nonplastic; many very fine to medium and common coarse roots; many very fine and fine and common medium tubular and irregular pores; 10 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.0; gradual smooth boundary.

AB—12 to 22 inches (30 to 56 cm); light brownish gray (10YR 6/2) stony medial sandy loam, dark grayish brown (10YR 4/2) moist; 3 percent clay; weak fine and medium subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; many very fine to medium and common coarse roots; many very fine and fine and common medium tubular and irregular pores; 5 percent stones, 5 percent cobbles, and 5 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

2Bw1—22 to 41 inches (56 to 104 cm); very pale brown (10YR 7/3) stony coarse sandy loam, brown (10YR 4/3) moist; 3 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine and fine and common medium tubular and irregular pores; 10 percent stones, 10 percent cobbles, and 10 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.4; gradual wavy boundary.

2Bw2—41 to 55 inches (104 to 140 cm); very pale brown (10YR 7/4) extremely bouldery coarse sandy loam, yellowish brown (10YR 5/4) moist; 2 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine to medium and few coarse tubular pores; 10 percent gravel, 15 percent stones, 20 percent very weakly cemented quartz diorite boulders, and 20 percent cobbles; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

2Bw3—55 to 74 inches (140 to 188 cm); very pale brown (10YR 7/4) extremely cobbly loamy coarse sand, yellowish brown (10YR 5/4) moist; 2 percent clay; weak fine subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; common very fine and fine and few medium roots; many very fine and fine and common medium tubular pores; 10 percent very weakly cemented quartz diorite boulders, 15 percent stones, 20 percent cobbles, and 20 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

2Bw4—74 to 87 inches (188 to 221 cm); very pale brown (10YR 8/4) extremely bouldery loamy coarse sand, brownish yellow (10YR 6/6) moist; 1 percent clay; single grain; loose, nonsticky, nonplastic; few very fine to medium roots; many very fine to medium irregular and tubular pores; 40 percent coarse irregular red (2.5YR 5/6 dry) oxidized iron masses; 10 percent stones, 10 percent cobbles, 15 percent gravel, and 30 percent very weakly cemented quartz diorite boulders; moderately acid, pH 6.0 by Hellige-Truog.

Type location: Butte County, California; about 1.5 miles north of Ramsey Bar, approximately 1,830 feet south and 1,720 feet west of the northeast corner of sec. 17, T. 17 N., R. 5 E.; 39 degrees, 56 minutes, 21 seconds north latitude and 121 degrees, 26 minutes, 8 seconds west longitude; NAD83; USGS Quad: Kimshew Point, California.

Range in Characteristics

The depth to dense glacial till is 20 to more than 80 inches (51 to 203 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The soil moisture control section is dry in all parts from about July to October (about 120 days). The particle-size control section averages 2 to 6 percent clay and 20 to 80 percent rock fragments. Redoximorphic features, such as iron masses with color of 2.5YR 4/6, 5YR 4/6 or 6/8, or 7.5YR 4/6 or 7/6, occur in the 2Bw horizon. NaF pH is 9.5 to 11.5 to a depth of 20 to 40 inches (51 to 102 cm). Rock fragments on the surface range from 15 to 40 percent gravel, 5 to 40 percent cobbles, 5 to 60 percent stones, and 5 to 60 percent boulders.

The A horizon has dry color of 10YR 4/2, 4/3, 5/2, 5/3, or 6/3. Moist color is 10YR 3/1, 3/2, or 4/2. Texture is medial sandy loam, gravelly medial sandy loam, very gravelly medial sandy loam, cobbly medial sandy loam, very stony medial sandy loam, very bouldery medial sandy loam, or extremely bouldery medial sandy loam. The content of clay ranges from 4 to 8 percent. The horizon has 5 to 35 percent gravel, 0 to 25 percent cobbles, 0 to 40 percent stones, and 0 to 40 percent boulders. Reaction is moderately acid or slightly acid.

The AB horizon has dry color of 10YR 5/4, 6/2, 6/3, or 6/4. Moist color is 10YR 3/3 or 4/2. Texture is extremely cobbly medial sandy loam, stony medial sandy loam, very stony medial sandy loam, extremely stony medial sandy loam, very bouldery medial sandy loam, or extremely bouldery medial coarse sandy loam. The content of clay ranges from 3 to 6 percent. The horizon has 5 to 15 percent gravel, 5 to 30 percent cobbles, 5 to 40 percent stones, and 0 to 40 percent boulders. Reaction is moderately acid or slightly acid.

The 2Bw horizon has dry color of 10YR 6/3, 6/4, 6/6, 7/3, 7/4, 8/4, or 8/6. Moist color is 10YR 4/2, 4/3, 4/4, 5/4, or 6/6. Texture is gravelly sandy loam, very gravelly sandy loam, cobbly sandy loam, very cobbly sandy loam, extremely cobbly sandy loam, very stony sandy loam, very bouldery sandy loam, stony coarse sandy loam, extremely bouldery coarse sandy loam, extremely cobbly loamy coarse sand, extremely stony loamy coarse sand, or extremely bouldery loamy coarse sand. The content of clay ranges from 1 to 5 percent. The horizon has 5 to 60 percent gravel, 0 to 25 percent cobbles, 0 to 40 percent stones, and 0 to 50 percent boulders. Reaction ranges from very strongly acid to slightly acid.

Haploxerands, Volcanic Till

Haploxerands, volcanic till, consist of moderately deep to very deep, moderately well drained or well drained soils that formed in glacial till derived from andesite, basalt, and quartz diorite. These soils are on moraines in the Cascade and Sierra Nevada Mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 82 inches (2,083 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Frigid Haploxerands

Typical Pedon

Haploxerands, volcanic till, on a northeast-facing slope of 10 percent, under a cover of white fir, incense cedar, ponderosa pine, sugar pine, California black oak, and

shrubs, at an elevation of 5,030 feet (1,533 m). When described on 7/13/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 4 cm); slightly decomposed plant material; abrupt smooth boundary.

A—2 to 4 inches (4 to 10 cm); brown (10YR 4/3) cobbly medial sandy loam, dark brown (7.5YR 3/3) moist; 7 percent clay; weak fine subangular blocky structure parting to single grain; loose, nonsticky, nonplastic; many very fine and fine and few medium roots; many very fine to medium and common coarse irregular and tubular pores; 5 percent gravel and 10 percent cobbles; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 10.5; clear smooth boundary.

Bw—4 to 17 inches (10 to 43 cm); brown (7.5YR 5/4) gravelly medial sandy loam, dark brown (7.5YR 3/4) moist; 10 percent clay; weak fine and medium granular structure; loose, nonsticky, nonplastic; many very fine to coarse roots; many very fine to coarse tubular pores; 5 percent stones, 10 percent cobbles, and 10 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 11.0; clear wavy boundary.

Bt1—17 to 37 inches (43 to 94 cm); light brown (7.5YR 6/4) gravelly sandy loam, strong brown (7.5YR 4/6) moist; 15 percent clay; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, nonplastic; many very fine to medium and few coarse roots; many very fine and fine and common medium tubular pores; 20 percent discontinuous faint clay films on surfaces along pores; 5 percent cobbles, 5 percent stones, and 15 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 10.5; clear smooth boundary.

Bt2—37 to 41 inches (94 to 104 cm); very pale brown (10YR 7/4) gravelly sandy loam, yellowish brown (10YR 5/4) moist; 19 percent clay; weak fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine to medium and few coarse roots; many very fine and fine and common medium tubular pores; 30 percent discontinuous faint clay films on surfaces along pores; 5 percent stones, 5 percent cobbles, and 20 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.5; clear smooth boundary.

2Cd1—41 to 52 inches (104 to 132 cm); light gray (10YR 7/1) gravelly sandy loam, grayish brown (10YR 5/2) moist; 7 percent clay; massive parting to moderate medium and thick platy structure; very hard, very firm, noncemented, nonsticky, nonplastic; few very fine to medium roots in cracks; few very fine tubular pores; 5 percent oxidized iron masses; 5 percent cobbles, 5 percent stones, and 10 percent gravel; very strongly acid, pH 4.8 by Hellige-Truog; abrupt smooth boundary.

2Cd2—52 to 80 inches (132 to 203 cm); very pale brown (10YR 7/3) gravelly sandy loam, grayish brown (10YR 5/2) moist; 3 percent clay; massive parting to moderate medium and thick platy structure; extremely hard, very firm, noncemented, nonsticky, nonplastic; few very fine to medium roots in cracks; few very fine tubular pores; 5 percent oxidized iron masses and 5 percent manganese coatings; 5 percent cobbles, 5 percent stones, and 15 percent gravel; very strongly acid, pH 4.8 by Hellige-Truog.

Type location: Butte County, California; about 2 miles north of Ramsey Bar, approximately 750 feet north and 2,110 feet east of the southwest corner of sec. 9, T. 24 N., R. 5 E.; 39 degrees, 56 minutes, 47 seconds north latitude and 121 degrees, 25 minutes, 19 seconds west longitude; NAD83; USGS Quad: Kimshew Point, California.

Range in Characteristics

The depth to dense glacial till is 20 to more than 80 inches (51 to 203 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The soil

moisture control section is dry in all parts from about July to October (about 120 days). The particle-size control section averages 8 to 18 percent clay and 20 to 80 percent rock fragments. Redoximorphic features, such as iron masses with color of 2.5YR 4/6, 5YR 4/6 or 6/8, or 7.5YR 4/6 or 7/6, occur in the 2Cd horizon. NaF pH is 9.5 to 11.5 to a depth of 20 to 40 inches (51 to 102 cm). Rock fragments on the surface range from 15 to 40 percent gravel, 5 to 40 percent cobbles, 5 to 60 percent stones, and 5 to 60 percent boulders.

The A horizon has dry color of 10YR 4/2 or 4/3 or 7.5YR 6/2. Moist color is 7.5YR 3/2 or 3/3 or 10YR 3/1. Texture is cobbly medial sandy loam, very gravelly medial sandy loam, or very stony medial sandy loam. The content of clay ranges from 6 to 12 percent. The horizon has 5 to 30 percent gravel, 10 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 10 percent boulders. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 7.5YR 5/4, 6/4, or 7/4. Moist color is 7.5YR 3/4, 4/3, 4/4, or 5/4. Texture is cobbly medial sandy loam, very gravelly medial sandy loam, extremely cobbly medial sandy loam, or very stony medial sandy loam. The content of clay ranges from 8 to 14 percent. The horizon has 5 to 35 percent gravel, 10 to 30 percent cobbles, 5 to 25 percent stones, and 0 to 20 percent boulders. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 10YR 6/6, 7/4, 8/6, or 8/4 or 7.5YR 6/4. Moist color is 10YR 4/4, 5/4, or 6/6 or 7.5YR 4/4 or 4/6. Texture is gravelly sandy loam, very bouldery sandy loam, extremely bouldery sandy loam, or extremely bouldery sandy clay loam. The content of clay ranges from 10 to 22 percent. The horizon has 5 to 20 percent gravel, 5 to 25 percent cobbles, 5 to 20 percent stones, and 0 to 50 percent boulders. Reaction ranges from strongly acid to slightly acid.

The 2Cd horizon has dry color of 10YR 7/1, 7/2, or 7/3; 2.5YR 8/3; or 5Y 7/3. Moist color is 10YR 5/2, 2.5Y 6/3, or 5Y 5/3. Texture is gravelly sandy loam or extremely bouldery loamy coarse sand. The content of clay ranges from 2 to 8 percent. The horizon has 10 to 20 percent gravel, 5 to 20 percent cobbles, 5 to 40 percent stones, and 0 to 40 percent boulders. Reaction ranges from very strongly acid to neutral.

Haploxererts

Haploxererts consist of deep or very deep, somewhat poorly drained soils that formed in mixed alluvium deposited over weathered metavolcanic rocks. These soils are in swales, in small basins, and on alluvium-influenced footslopes along terrace and Sierra Nevada foothill margins. Slopes range from 0 to 5 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Haploxererts

Typical Pedon

Haploxererts, gravelly silty clay, on an east-facing slope of 5 percent, under a cover of soft chess, hedgehog dogtail, medusahead, tarweed, brodiaea, and other annual grasses and forbs, at an elevation of 210 feet (64 m). When described on 10/15/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); dark brown (7.5YR 3/3) gravelly silty clay, dark brown (7.5YR 3/3) moist; 43 percent clay; strong fine and medium subangular blocky structure; very hard, very firm, very sticky, very plastic; many very fine roots; many very fine tubular pores; 1 percent fine spherical manganese masses; 15 percent subrounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bw—2 to 10 inches (5 to 25 cm); dark brown (7.5YR 3/4) gravelly clay, dark brown (7.5YR 3/3) moist; 60 percent clay; strong coarse prismatic structure parting to strong medium and coarse angular blocky; extremely hard, extremely firm, very sticky, very plastic; many very fine roots; many very fine tubular pores; 1 percent fine spherical manganese masses; 15 percent subrounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bss—10 to 30 inches (25 to 76 cm); dark brown (7.5YR 3/4) gravelly clay, dark brown (7.5YR 3/3) moist; 65 percent clay; strong coarse prismatic structure parting to strong medium and coarse angular blocky; extremely hard, extremely firm, very sticky, very plastic; few coarse and many very fine roots; many very fine tubular pores; 15 percent continuous prominent slickensides; 1 percent fine spherical manganese masses; 20 percent subrounded mixed gravel; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.

2BCt1—30 to 33 inches (76 to 84 cm); light yellowish brown (10YR 6/4) and yellowish brown (10YR 5/4) silty clay, yellowish brown (10YR 5/4) moist; 55 percent clay; strong fine and medium subangular blocky structure; very hard, very firm, very sticky, very plastic; common very fine roots; few fine and many very fine tubular pores; 1 percent fine spherical manganese masses; 5 percent subrounded mixed gravel; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

2BCt2—33 to 41 inches (84 to 104 cm); yellowish brown (10YR 5/4) silty clay, yellowish brown (10YR 5/4) moist; 45 percent clay; strong medium and coarse subangular blocky structure; very hard, very firm, very sticky, very plastic; few very fine roots; few fine and many very fine tubular pores; 1 percent fine spherical manganese masses; 5 percent subrounded mixed gravel; neutral, pH 7.0 by Hellige-Truog; clear wavy boundary.

2Cr—41 to 44 inches (104 to 112 cm); weakly cemented greenschist.

Type location: Butte County, California; about 5.4 miles northeast of Honcut, approximately 500 feet north and 2,200 feet east of the southwest corner of sec. 35, T. 18 N., R. 4 E.; 39 degrees, 22 minutes, 4 seconds north latitude and 121 degrees, 29 minutes, 22 seconds west longitude; NAD83; USGS Quad: Loma Rica, California.

Range in Characteristics

The depth to paralithic bedrock is more than 40 inches (102 cm). The mean annual soil temperature is 61 to 65 degrees F (16 to 18 degrees C). The particle-size control section averages 55 to 65 percent clay and 3 to 20 percent rock fragments, mostly gravel. Mineralogy is smectitic. Reversible, surface-initiated cracks 3/8 to 1 inch (1 to 3 cm) wide extend to a depth of 30 inches (76 cm) from May to October (about 165 days) when the soils are not irrigated. Few or common slickensides are in the Bss horizon, from 10 to 30 inches (25 to 76 cm). A fluctuating water table can occur from the top of the bedrock to the surface of the soil from November through April. Redoximorphic features, such as oxidized iron masses and manganese masses, can occur in all horizons. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 3/3 or 10YR 3/4. Moist color is 7.5YR 3/3. Texture is silty clay loam, gravelly silty clay loam, silty clay, or gravelly silty clay. The content of clay ranges from 30 to 45 percent. The horizon has 0 to 15 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 1 to 3 percent. By sum of cations, base saturation ranges from 65 to 75 percent. Reaction ranges from strongly acid to slightly acid.

The Bw horizon has dry color of 7.5YR 3/3 or 3/4 or 5/4. Moist color is 7.5YR 3/2, 3/3, or 4/4. Texture is clay or gravelly clay. The content of clay ranges from 45 to 60 percent. The content of gravel is 5 to 15 percent. The content of organic matter is 0.5 to 1.5 percent. By sum of cations, base saturation ranges from 70 to 90 percent. Reaction is slightly acid or neutral.

The Bss horizon has dry color of 7.5YR 3/4. Moist color is 7.5YR 3/3. Texture is clay or gravelly clay. The content of clay ranges from 50 to 65 percent. The content of gravel is 3 to 20 percent. By sum of cations, base saturation ranges from 75 to 95 percent. Reaction is slightly acid or neutral.

The 2BCt horizon has dry color of 10YR 5/4, 5/6, or 6/4 or 7.5YR 5/6. Moist color is 10YR 4/6 or 5/4 or 7.5YR 4/6. Texture is silty clay or clay. The content of clay ranges from 40 to 55 percent. The content of gravel is 0 to 10 percent. By sum of cations, base saturation ranges from 80 to 95 percent. Reaction ranges from neutral to moderately alkaline.

The 2Cr horizon has dry color of 10YR 6/4. Moist color is 10YR 5/6. Texture is silty clay or clay. The content of clay ranges from 35 to 45 percent. Redoximorphic features occur as manganese masses and oxidized iron masses. Reaction ranges from neutral to moderately alkaline.

Haploxerolls

Haploxerolls consist of deep, moderately well drained soils that formed in alluvium derived from volcanic rocks. These soils are on alluvial fans. Slopes range from 0 to 2 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Haploxerolls

Typical Pedon

Haploxerolls loam, on a slope of 1 percent, under a cover of almond trees, at an elevation of 170 feet (52 m). When described on 9/9/1993, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 5 inches (0 to 13 cm); brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; 24 percent clay; strong medium subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; common very fine and fine and few medium roots; many fine irregular and common very fine tubular pores; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Ap2—5 to 16 inches (13 to 41 cm); brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; common very fine and fine and few medium roots; common very fine tubular pores; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bw1—16 to 27 inches (41 to 69 cm); brown (7.5YR 5/3) loam, dark brown (7.5YR 3/3) moist; 24 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; few coarse and common very fine to medium roots; common very fine tubular pores; neutral, pH 7.1 by Hellige-Truog; clear smooth boundary.

Bw2—27 to 40 inches (69 to 102 cm); brown (7.5YR 5/3) loam, dark brown (7.5YR 3/3) moist; 22 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; common very fine to coarse roots; common very fine tubular pores; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bw3—40 to 48 inches (102 to 122 cm); brown (7.5YR 5/4) loam, dark brown (7.5YR 3/3) moist; 23 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; few very fine and fine and common medium roots; common very fine tubular pores; neutral, pH 7.3 by Hellige-Truog; clear smooth boundary.

Bw4—48 to 52 inches (122 to 132 cm); brown (7.5YR 5/4) sandy loam, dark brown (7.5YR 3/4) moist; 13 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few very fine and fine and common medium roots; many very fine irregular pores; 40 percent fine and medium durinodes; neutral, pH 7.3 by Hellige-Truog; abrupt smooth boundary.
2Bqm—52 inches (132 cm); indurated duripan.

Type location: Butte County, California; about 2.4 miles northwest of Cana; T. 23 N., R. 1 W.; in an unsectionized area in the Bosquejo Land Grant; 39 degrees, 51 minutes, 59 seconds north latitude and 122 degrees, 1 minute, 35 seconds west longitude; NAD27; USGS Quad: Foster Island, California.

Range in Characteristics

Depth to the duripan is 40 to 60 inches (102 to 152 cm) or more. The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 23 to 31 percent clay. Mineralogy is mixed. A fluctuating water table can occur from the top of the duripan to 20 inches (51 cm) below the surface of the soil from December through April.

The Ap horizon has dry color of 10YR 4/3 or 5/3. Moist color is 10YR 3/2 or 3/3. Texture is loam, clay loam, silt loam, or silty clay loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 0 to 2 percent. The content of organic matter is 2.5 to 5 percent. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 10YR 5/3, 5/4, or 6/4 or 7.5YR 4/4, 4/6, 5/3, or 5/4. Moist color is 10YR 3/3, 3/4, or 4/3 or 7.5YR 3/3, 3/4, or 4/3. Texture is clay loam, loam, silty clay loam, silt loam, sandy clay loam, or sandy loam. The content of clay ranges from 9 to 35 percent. The content of gravel is 0 to 10 percent. The content of organic matter is 0.1 to 2.5 percent. This horizon is noneffervescent to strongly effervescent. Reaction ranges from neutral to moderately alkaline.

The C horizon, where it occurs, has dry color of 7.5YR 5/4 or 10YR 5/4. Moist color is 7.5YR 3/4 or 10YR 3/4. Texture is sandy loam, loam, or silt loam. The content of clay ranges from 10 to 27 percent. The content of organic matter is 0.1 to 0.8 percent. This horizon is noneffervescent to strongly effervescent. Reaction is neutral or slightly alkaline.

The 2Bqm horizon is slightly effervescent to strongly effervescent. Redoximorphic features include manganese masses and oxidized iron masses on top of the duripan. The horizon is slightly cemented to indurated.

Hartsmill Series

The Hartsmill series consists of very deep, well drained soils that formed in colluvium and residuum derived from metavolcanic rocks, mainly greenschist. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 2 to 90 percent. The mean annual precipitation is about 43 inches (109 cm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Ultic Palexeralfs

Typical Pedon

Hartsmill gravelly loam, on a southwest-facing slope of 46 percent, under a cover of whiteleaf manzanita, toyon, interior live oak, California black oak, Pacific poison oak, and very scattered ponderosa pine, at an elevation of 1,840 feet (561 m). When described on 7/27/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.
A—1 to 3 inches (3 to 8 cm); reddish brown (5YR 4/4) gravelly loam, dark reddish brown (5YR 3/3) moist; 14 percent clay; strong fine granular structure; soft, very friable, nonsticky, slightly plastic; common very fine roots; many very fine irregular pores; 30 percent angular gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.
Bt1—3 to 6 inches (8 to 15 cm); yellowish red (5YR 4/6) very gravelly loam, dark reddish brown (5YR 3/4) moist; 17 percent clay; strong coarse subangular blocky structure; hard, friable, nonsticky, slightly plastic; common fine and few medium and very fine roots; few very fine tubular pores; 10 percent continuous distinct clay films on surfaces along pores; 40 percent angular gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.
Bt2—6 to 13 inches (15 to 33 cm); yellowish red (5YR 4/6) very gravelly loam, dark reddish brown (2.5YR 3/4) moist; 20 percent clay; moderate medium subangular blocky structure; slightly hard, friable, nonsticky, moderately plastic; common fine and few medium and coarse roots; many very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds; 45 percent angular gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.
Bt3—13 to 24 inches (33 to 61 cm); red (2.5YR 4/6) very gravelly loam, dark reddish brown (2.5YR 3/4) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common fine and few medium and coarse roots; common very fine tubular pores; 45 percent continuous distinct clay films; 45 percent angular gravel; slightly acid, pH 6.3 by Hellige-Truog; gradual wavy boundary.
BCt1—24 to 35 inches (61 to 89 cm); red (2.5YR 4/6) very cobbly clay loam, dark red (2.5YR 3/6) moist; 33 percent clay; moderate medium angular blocky structure; hard, firm, moderately sticky, very plastic; few medium and coarse roots; common very fine tubular pores; 60 percent continuous distinct clay films on faces of peds and 90 percent continuous prominent clay films on rock fragments; 10 percent angular gravel and 40 percent angular cobbles; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.
BCt2—35 to 62 inches (89 to 157 cm); red (2.5YR 4/6) extremely cobbly clay loam, dark red (2.5YR 3/6) moist; 38 percent clay; moderate medium angular blocky structure; hard, very firm, moderately sticky, very plastic; few fine roots; common very fine tubular pores; 70 percent continuous distinct clay films on all faces of peds and 90 percent continuous distinct clay films on rock fragments; 10 percent angular gravel and 55 percent angular cobbles; slightly acid, pH 6.2 by Hellige-Truog; gradual wavy boundary.
Crt—62 inches (157 cm); moderately cemented, weathered greenschist with 90 percent continuous prominent clay films.

Type location: Butte County, California; about 5.8 miles northeast of Oroville Dam, approximately 2,250 feet west and 2,150 feet north of the southeast corner of sec. 9, T. 20 N., R. 5 E.; 39 degrees, 36 minutes, 16.41 seconds north latitude and 121 degrees, 25 minutes, 05.33 seconds west longitude; NAD83; USGS Quad: Oroville Dam, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 59 to 63 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 200 days). The particle-size control section averages 20 to 27 percent clay and 35 to 50 percent rock

fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 3 percent to a depth of 13 inches (33 cm) and is less than 1 percent below that depth. Rock fragments on the surface range from 0 to 15 percent gravel, 0 to 10 percent cobbles, 0 to 15 percent stones, and 0 to 15 percent boulders. Some pedons have a BAt horizon.

The A horizon has dry color of 5YR 4/4, 4/6, or 5/6. Moist color is 5YR 3/3, 3/4, or 4/6. Texture is gravelly loam with a high content of silt. The content of clay ranges from 14 to 18 percent. The content of gravel is 10 to 30 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 4/6 or 5/6 or 2.5YR 3/6 or 4/6. Moist color is 5YR 3/4 or 2.5YR 3/4 or 3/6. Texture is very gravelly loam, gravelly loam, gravelly clay loam, very gravelly clay loam, or extremely gravelly clay with a high content of silt. The content of clay ranges from 17 to 30 percent. The horizon has 10 to 50 percent gravel and 0 to 15 percent cobbles. Reaction ranges from moderately acid to neutral.

The BCt horizon has dry color of 2.5YR 4/6. Moist color is 2.5YR 3/6. Texture is very cobbly or extremely cobbly clay loam. The content of clay ranges from 28 to 40 percent. The horizon has 0 to 10 percent gravel and 40 to 55 percent cobbles. Reaction is moderately acid or slightly acid.

Hietanen Series

The Hietanen series consists of deep, well drained soils that formed in residuum and colluvium derived from metasedimentary rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Typic Haploxerults

Typical Pedon

Hietanen gravelly loam, on a southwest-facing slope of 20 percent, under a cover of ponderosa pine and white fir, at an elevation of 3,600 feet (1,097 m). When described on 7/13/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 3 inches (3 to 8 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 20 percent clay; moderate fine and medium granular structure; soft, very friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium irregular and tubular pores; 25 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 9.8; clear smooth boundary.

Bt1—3 to 8 inches (8 to 20 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/4) moist; 24 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine and fine tubular pores; 50 percent faint clay films; 5 percent cobbles and 15 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt2—8 to 19 inches (20 to 48 cm); reddish yellow (7.5YR 6/6) silt loam, reddish brown (5YR 4/4) moist; 27 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine and fine and few medium tubular pores; 50 percent faint clay films; 10 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.5; gradual smooth boundary.

Bt3—19 to 30 inches (48 to 76 cm); yellow (10YR 8/6) silt loam, brownish yellow (10YR 6/6) moist; 24 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to coarse roots; common very fine and fine tubular pores; 50 percent distinct clay films; 12 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.2; gradual smooth boundary.

Bt4—30 to 53 inches (76 to 135 cm); yellow (10YR 7/6) silt loam, yellowish brown (10YR 5/6) moist; 22 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine to medium roots; common very fine and fine tubular pores; 50 percent distinct clay films; 10 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.5; clear smooth boundary.

Cr—53 inches (135 cm); very weakly cemented phyllite bedrock; few very fine to medium roots; few very fine irregular and tubular pores; strongly acid, pH 5.5 by Hellige-Truog.

Type location: Butte County, California; about 3.2 miles northeast of Sawmill Peak, approximately 1,500 feet north and 360 feet west of the southeast corner of sec. 22, T. 23 N., R. 4 E.; 39 degrees, 49 minutes, 60 seconds north latitude and 121 degrees, 30 minutes, 20 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 50 to 57 degrees F (10 to 14 degrees C). The particle-size control section averages 24 to 35 percent clay and 2 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 5 to 30 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. Some pedons have a very gravelly Bt/Cr horizon.

The A horizon has dry color of 10YR 5/2, 5/3, or 6/4; 7.5YR 5/4, 6/3, 6/4, 7/3, or 7/4; or 5YR 6/4. Moist color is 10YR 3/2, 4/2, or 4/3; 7.5YR 3/4, 4/2, 4/3, or 4/4; or 5YR 4/3 or 4/4. Texture is loam, gravelly loam, very gravelly loam, or silt loam. The content of clay ranges from 18 to 27 percent. The content of gravel is 5 to 40 percent. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 7.5YR 5/4, 5/6, 6/4, or 6/6; 5YR 6/4 or 6/6; 10YR 5/4, 6/4, 7/2, 7/4, 7/6, or 8/6; or 2.5Y 5/3 or 7/4. Moist color is 7.5YR 4/3, 4/4, 4/6, or 5/6; 5YR 4/4, 4/6, or 5/6; 10YR 4/2, 4/3, 5/4, 5/6, or 6/6; or 2.5Y 4/2, 4/3, or 5/4. Hues of 10YR and 2.5Y normally occur in the lower part of the horizon. Texture is loam, gravelly loam, clay loam, gravelly clay loam, silt loam, gravelly silt loam, silty clay loam, or gravelly silty clay loam. The content of clay ranges from 22 to 35 percent. The horizon has 2 to 30 percent gravel and 0 to 10 percent cobbles. Reaction ranges from strongly acid to slightly acid.

Hoda Series

The Hoda series consists of very deep, well drained soils that formed in colluvium and residuum derived from granodiorite. These soils are in the Sierra Nevada Mountains. Slopes range from 3 to 50 percent. The mean annual precipitation is about 50 inches (1,270 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Fine, kaolinitic, mesic Ultic Haploxeralfs

Typical Pedon

Hoda loam. (Colors are for dry soil unless otherwise noted.)

Oi—1 inch to 0 (3 cm to 0); litter and duff.
A—0 to 7 inches (0 to 18 cm); brown (7.5YR 5/4) loam, brown (7.5YR 4/4) moist; moderate very fine and fine granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine and fine interstitial pores; slightly acid; clear smooth boundary.
Bt1—7 to 14 inches (18 to 36 cm); reddish yellow (5YR 6/6) clay loam, yellowish red (5YR 5/6) moist; weak fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; common very fine and fine interstitial pores; few thin clay films coating mineral grains; slightly acid; clear smooth boundary.
Bt2—14 to 21 inches (36 to 53 cm); yellowish red (5YR 5/8) clay, yellowish red (5YR 4/8) moist; moderate medium angular blocky structure; hard, friable, sticky, plastic; common medium and coarse roots; common very fine and fine tubular pores; common thin clay films on faces of peds and common moderately thick clay films in pores; slightly acid; gradual wavy boundary.
Bt3—21 to 48 inches (53 to 122 cm); reddish yellow (5YR 6/8) clay, yellowish red (5YR 5/8) moist; moderate medium angular blocky structure; hard, friable, sticky, plastic; common medium and coarse roots; common very fine and fine tubular and interstitial pores; common moderately thick clay films on faces of peds and in pores; moderately acid; clear irregular boundary.
BCt—48 to 72 inches (122 to 183 cm); reddish yellow (7.5YR 6/8) clay loam, strong brown (7.5YR 5/8) moist; massive; slightly hard, friable, slightly sticky, slightly plastic; common medium and coarse roots; few very fine interstitial pores; few thin clay films in pores; moderately acid.

Type location: Yuba County, California; about 5.4 miles southeast of Challenge, approximately 100 feet south and 700 feet east of the northwest corner of sec. 6, T. 18 N., R. 8 E.; 39 degrees, 27 minutes, 18.78 seconds north latitude and 121 degrees, 7 minutes, 41.05 seconds west longitude; NAD27; USGS Quad: Challenge, California.

Range in Characteristics

The thickness of the solum ranges from 40 to 80 inches (102 to 203 cm), and the depth to paralithic bedrock is more than 80 inches (203 cm). The mean annual soil temperature is 50 to 54 degrees F (10 to 12 degrees C). The particle-size control section ranges from 35 to 50 percent clay. Mineralogy is kaolinitic. The content of organic matter is 2 to 6 percent to a depth of 72 inches (183 cm).

The A horizon has dry color of 10YR 5/2, 5/3, 4/3, or 3/3 or 7.5YR 5/4, 4/6, 4/2, or 4/4. Moist color is 10YR 3/3 or 3/4 or 7.5YR 3/4, 4/2, 4/4, 5/6, or 5/8. Moist chroma of 4 or more is below a depth of 5 inches (13 cm). Texture is loam. The content of clay ranges from 7 to 18 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 8/6, 7/8, 7/6, 6/8, or 6/6 or 5YR 7/8, 7/6, 6/8, 6/6, 5/8, 5/6, 4/8, or 4/6. Texture is clay loam or clay. The content of clay ranges from 35 to 50 percent. Reaction ranges from strongly acid to slightly acid.

Holillipah Series

The Holillipah series consists of very deep, somewhat excessively drained soils that formed in alluvium derived from mixed sources. These soils are on flood plains. Slopes are 0 to 1 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Sandy, mixed, thermic Typic Xerofluvents

Typical Pedon

Holillipah loamy sand. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 6 inches (0 to 15 cm); light yellowish brown (10YR 6/4) loamy sand, brown (10YR 4/3) moist; weak medium granular structure; soft, very friable, nonsticky, nonplastic; few very fine roots; many very fine interstitial pores; neutral; abrupt wavy boundary.

C1—6 to 9 inches (15 to 23 cm); pale brown (10YR 6/3) sand, brown (10YR 5/3) moist; strata, 1 to 2 millimeters thick, and pockets, 1 to 2 centimeters across, of yellowish brown (10YR 5/6) silt loam; single grain; loose, nonsticky, nonplastic; many very fine interstitial pores; neutral; clear wavy boundary.

C2—9 to 20 inches (23 to 51 cm); light gray (10YR 7/1), stratified sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky, nonplastic; neutral; abrupt wavy boundary.

C3—20 to 26 inches (51 to 66 cm); very pale brown (10YR 7/4) fine sandy loam, yellowish brown (10YR 5/4) moist; massive; soft, very friable, nonsticky, nonplastic; common fine distinct brown (10YR 5/3) oxidized iron masses; neutral; abrupt wavy boundary.

C4—26 to 38 inches (66 to 96 cm); light gray (10YR 7/1), stratified sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky, nonplastic; continuous yellow (10YR 7/8) oxidized iron masses in a 0.5- to 1-millimeter stratum; neutral; abrupt smooth boundary.

C5—38 to 46 inches (96 to 117 cm); mixed very pale brown (10YR 7/3) and pale brown (10YR 6/3), stratified sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky, nonplastic; 2 percent rounded gravel; continuous yellowish brown (10YR 5/8) iron masses in a 1-millimeter stratum; many coarse prominent dark yellowish brown (10YR 4/4) and few medium prominent dusky red (2.5YR 3/2) oxidized iron masses; manganese stains; neutral; abrupt smooth boundary.

C6—46 to 48 inches (117 to 122 cm); light gray (10YR 7/2) loamy fine sand, dark brown (10YR 3/3) moist; single grain; soft, very friable, nonsticky, nonplastic; neutral; abrupt smooth boundary.

C7—48 to 57 inches (122 to 145 cm); light gray (10YR 7/1), stratified sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky, nonplastic; neutral; abrupt smooth boundary.

C8—57 to 66 inches (145 to 168 cm); light gray (10YR 7/2), stratified sand, grayish brown (10YR 5/2) moist; single grain; loose, nonsticky, nonplastic; common fine prominent yellow (10YR 6/8) iron masses in fine strata; neutral; abrupt smooth boundary.

Type location: Yuba County, California; about 3.8 miles northeast of Marysville, approximately 850 feet (253 m) north of Hooper Road and 300 feet (91 m) east of Hallwood Boulevard; T. 16 N., R. 4 E.; in an unsectionized area in the Honcut Rancho Land Grant; 39 degrees, 12 minutes, 5 seconds north latitude and 121 degrees, 30 minutes, 33 seconds west longitude; NAD27; USGS Quad: Yuba City, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm). The mean annual soil temperature is 64 or 65 degrees F (18 degrees C). Mineralogy is mixed. Unless the soils are irrigated, the soil moisture control section is dry in all parts from about May through October and moist in some or all parts from about November through April. Texture is stratified sand, loamy sand, sandy loam, or fine sandy loam. The content of clay ranges from 0 to 10 percent. The content of organic carbon decreases irregularly with increasing depth. Reaction is slightly acid or neutral.

The A horizon has dry color of 10YR 6/4 or 6/3. Moist color is 10YR 4/4 or 4/3.

The C horizon has dry color of 10YR 8/1, 7/4, 7/3, 7/2, 7/1, or 6/3. Moist color is 10YR 7/2, 6/2, 5/4, 5/3, 5/2, 4/4, 4/3, or 3/3. The horizon has distinct or prominent redoximorphic features.

Holland Series

The Holland series consists of very deep, well drained soils that formed in colluvium and residuum derived from granodiorite. These soils are in the Sierra Nevada Mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 50 inches (1,270 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, semiactive, mesic Ultic Haploxeralfs

Typical Pedon

Holland loam. (Colors are for dry soil unless otherwise noted.)

Oi—2 inches to 0 (5 cm to 0); litter and duff.
A1—0 to 4 inches (0 to 10 cm); brown (7.5YR 5/4) loam, brown (7.5YR 4/4) moist; weak very fine and fine granular structure; soft, friable, nonsticky, nonplastic; common very fine and fine and few medium roots; common very fine and fine irregular pores; slightly acid; gradual smooth boundary.
A2—4 to 15 inches (10 to 38 cm); reddish brown (5YR 5/4) loam, reddish brown (5YR 4/4) moist; weak fine subangular blocky structure; soft, friable, nonsticky, nonplastic; few medium and coarse and common fine roots; common very fine and fine irregular pores; slightly acid; gradual wavy boundary.
Bt1—15 to 35 inches (38 to 89 cm); reddish yellow (5YR 6/8) clay loam, yellowish red (5YR 4/8) moist; moderate fine subangular blocky structure; hard, firm, nonsticky, slightly plastic; few fine to coarse roots; common fine and very fine irregular pores; common thin clay films on faces of peds and in pores; moderately acid; clear wavy boundary.
Bt2—35 to 50 inches (89 to 127 cm); reddish yellow (7.5YR 6/8) clay loam, strong brown (7.5YR 5/8) moist; massive; slightly hard, friable, nonsticky, slightly plastic; few medium and coarse roots; common very fine and fine irregular and common fine tubular pores; common thin clay films bridging mineral grains; moderately acid; gradual irregular boundary.
BCt—50 to 65 inches (127 to 165 cm); reddish yellow (7.5YR 7/8) clay loam, reddish yellow (7.5YR 6/8) moist; massive; slightly hard, friable, nonsticky, slightly plastic; few medium roots; common very fine and fine irregular pores; common thin clay films bridging mineral grains; strongly acid.

Type location: Yuba County, California; about 4.2 miles southeast of Challenge, approximately 1,600 feet south and 300 feet east of the northwest corner of sec. 36, T. 19 N., R. 7 E.; 39 degrees, 27 minutes, 56.58 seconds north latitude and 121 degrees, 8 minutes, 48.2 seconds west longitude; NAD27; USGS Quad: Challenge, California.

Range in Characteristics

The depth of the soils is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 54 degrees F (11 to 12 degrees C). The soil moisture control section is dry in all parts from about July 15 to October 15 (about 95 days). Mineralogy is mixed. The content of organic matter is 2 to 5 percent to a depth of 65 inches (165 cm).

The A horizon has dry color of 10YR 5/3, 5/2, 4/3, 4/2, or 3/3; 7.5YR 5/4, 5/2, 4/4, or 4/2; or 5YR 5/4. Texture is sandy loam or loam. The content of clay ranges from 12 to 25 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 6/8, 6/6, 6/4, 5/8, 5/6, 5/4, 4/6, or 4/4 or 5YR 6/8, 6/6, 5/8, 5/6, 5/4, 4/8, 4/6, or 4/4. Texture is sandy clay loam or clay loam. The content of clay ranges from 25 to 35 percent. Reaction ranges from strongly acid to slightly acid.

The BCt horizon has dry color of 7.5YR 7/8, 5/6, or 4/6. Moist color is 7.5YR 4/4, 4/6, 5/4, or 6/8. Texture is sandy clay loam or clay loam. The content of clay ranges from 25 to 35 percent.

Hotaw Series

The Hotaw series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from granodiorite. These soils are in the Sierra Nevada Mountains. Slopes range from 5 to 75 percent. The mean annual precipitation is about 50 inches (1,270 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

Typical Pedon

Hotaw loam. (Colors are for dry soil unless otherwise noted.)

Oi—1 inch to 0 (3 cm to 0); litter and duff.

A1—0 to 4 inches (0 to 10 cm); brown (7.5YR 5/4) loam, brown (7.5YR 4/4) moist; moderate fine granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine and fine irregular pores; slightly acid; gradual smooth boundary.

A2—4 to 12 inches (10 to 30 cm); light brown (7.5YR 6/4) loam, brown (7.5YR 5/4) moist; weak medium subangular blocky structure; soft, friable, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; many very fine and fine irregular pores; slightly acid; gradual wavy boundary.

Bt—12 to 34 inches (30 to 86 cm); light yellowish brown (10YR 6/4) sandy clay loam, yellowish brown (10YR 5/6) moist; moderate medium subangular blocky structure; hard, firm, sticky, plastic; common fine and medium and many coarse roots; common very fine and fine tubular pores; common moderately thick clay films in pores; moderately acid; clear wavy boundary.

Cr—34 to 50 inches (86 to 127 cm); weathered granodiorite.

Type location: Yuba County, California; about 4.1 miles west of Camptonville, approximately 700 feet south and 2,200 feet west of the northeast corner of sec. 6, T. 18 N., R. 8 E.; 39 degrees, 27 minutes, 32.1 seconds north latitude and 121 degrees, 7 minutes, 26.04 seconds west longitude; NAD27; USGS Quad: Camptonville, California.

Range in Characteristics

The depth to paralithic bedrock ranges from 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 52 to 56 degrees F (11 to 13 degrees C). The particle-size control section ranges from 18 to 25 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 5 percent to a depth of 38 inches (97 cm).

The A horizon has dry color of 10YR 6/4, 6/3, 5/8, 5/6, 5/4, 5/3, 4/3, or 3/4 or 7.5YR 6/4, 5/4, 5/2, 4/4, or 4/2. Texture is loam or sandy loam. The content of clay ranges from 7 to 15 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 10YR 6/4, 5/6, 5/3, or 4/3 or 7.5YR 6/8, 6/4, 5/8, 5/6, 5/4, 5/2, 4/6, 4/4, or 4/2. Texture is sandy clay loam or clay loam. The content of clay ranges from 20 to 35 percent. Reaction ranges from strongly acid to slightly acid.

Hurleton Series

The Hurleton series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from metamorphic and intrusive igneous rocks, mainly quartz diorite and gabbro. These soils are on ridgetops and side slopes on plutons on Sierra foothills. Slopes range from 2 to 50 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, thermic Ultic Haploxeralfs

Typical Pedon

Hurleton gravelly sandy loam, on a south-facing slope of 9 percent, under a cover of blue oak, foothill pine, interior live oak, whiteleaf manzanita, chaparral coffeeberry, Pacific poison oak, rattlesnake brome, ripgut brome, wild onion, and rose clover, at an elevation of 1,300 feet (396 m). When described on 8/4/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A1—0 to 3 inches (0 to 8 cm); brown (10YR 5/3) gravelly sandy loam, dark brown (10YR 3/3) moist; 10 percent clay; moderate very fine and fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; many very fine roots; common medium and many very fine tubular pores; 22 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

A2—3 to 7 inches (8 to 18 cm); yellowish brown (10YR 5/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; 12 percent clay; moderate very fine and fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; many very fine roots; many very fine and fine tubular pores; 20 percent subangular gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

BA—7 to 12 inches (18 to 30 cm); brown (7.5YR 5/4) gravelly sandy loam, dark brown (7.5YR 3/4) moist; 14 percent clay; moderate medium subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; many very fine roots; many very fine tubular pores; 30 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

Bt1—12 to 16 inches (30 to 41 cm); strong brown (7.5YR 5/6) very gravelly sandy loam, strong brown (7.5YR 4/6) moist; 16 percent clay; moderate fine subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine and fine tubular pores; 10 percent patchy faint clay films on faces of peds; 55 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

Bt2—16 to 19 inches (41 to 48 cm); strong brown (7.5YR 5/6) very gravelly sandy loam, strong brown (7.5YR 4/6) moist; 19 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine tubular pores; 10 percent patchy faint clay films on faces of peds; 45 percent subangular gravel; slightly acid, pH 6.4 by Hellige-Truog; clear smooth boundary.

Bt3—19 to 25 inches (48 to 64 cm); reddish yellow (7.5YR 6/6) extremely gravelly sandy clay loam, strong brown (7.5YR 4/6) moist; 23 percent clay; strong fine and medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; few very fine and medium roots; few very fine tubular pores; 10 percent patchy faint clay films on all faces of peds; 70 percent subangular gravel; moderately acid, pH 5.7 by Hellige-Truog; abrupt smooth boundary.

R—25 inches (64 cm); reddish yellow (7.5YR 6/6), indurated quartz diorite bedrock, strong brown (7.5YR 5/6) moist.

Type location: Butte County, California; about 2.6 miles southwest of Hurleton, approximately 2,700 feet south and 2,000 feet east of the northwest corner of sec. 21, T. 19 N., R. 5 E.; 39 degrees, 29 minutes, 14.99 seconds north latitude and 121 degrees, 25 minutes, 17.37 seconds west longitude; NAD83; USGS Quad: Bangor, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 63 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 20 to 26 percent clay and 36 to 70 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed.

The A horizon has dry color of 10YR 5/3 or 5/4 or 7.5YR 5/4. Moist color is 10YR 2/2, 3/2, 3/3, or 3/4 or 7.5YR 3/4. Texture is sandy loam, gravelly sandy loam, or very gravelly loam. The content of clay ranges from 10 to 17 percent. The content of gravel is 10 to 45 percent. By sum of cations, base saturation ranges from 45 to 60 percent. The content of organic matter is 3 to 8 percent. Reaction is moderately acid or slightly acid.

The BA horizon has dry color of 7.5YR 5/3, 5/4, 5/6, 6/3, or 6/4. Moist color is 7.5YR 3/2, 3/4, 4/3, or 4/4. Texture is gravelly or very gravelly sandy loam. The content of clay ranges from 14 to 20 percent. The horizon has 25 to 45 percent gravel and 0 to 45 percent cobbles. By sum of cations, base saturation ranges from 50 to 65 percent. The content of organic matter is 1.2 to 3 percent. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 5/4, 6/4, 6/6, or 7/2. Moist color is 7.5YR 4/4, 5/4, or 6/2. Texture is very gravelly sandy loam, very gravelly loam, or very gravelly sandy clay loam. The content of clay ranges from 16 to 24 percent. The content of gravel is 35 to 60 percent, and the content of cobbles is 0 to 60 percent. By sum of cations, base saturation ranges from 60 to 74 percent. The content of organic matter is 0.4 to 1.3 percent. Reaction is moderately acid or slightly acid.

The middle part of the Bt horizon has dry color of 7.5YR 5/6, 6/4, 6/6, or 7/4. Moist color is 7.5YR 4/3, 4/6, or 5/6. Texture is very gravelly sandy loam, very gravelly loam, very cobbly loam, or very gravelly sandy clay loam. The content of clay ranges from 19 to 32 percent. The content of gravel is 25 to 45 percent, and the content of cobbles is 0 to 60 percent. By sum of cations, base saturation ranges from 75 to 85 percent. The content of organic matter is 0.2 to 0.6 percent. Reaction ranges from very strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 7.5YR 5/6, 5/8, or 6/6 or 10YR 5/4. Moist color is 7.5YR 4/4, 4/6, or 5/6 or 10YR 4/4. Texture is very gravelly sandy clay loam, extremely gravelly sandy clay loam, or extremely cobbly sandy clay loam. The content of clay ranges from 20 to 35 percent. The content of gravel is 35 to 70 percent, and the content of cobbles is 0 to 60 percent. By sum of cations, base saturation ranges from 75 to 85 percent. The content of organic matter is 0 to 0.4 percent. Reaction ranges from strongly acid to slightly acid.

Ignord Series

The Ignord series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on distal alluvial fans. Slopes range from 0 to 2 percent. The mean annual precipitation is about 21 inches (533 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Coarse-loamy, mixed, superactive, thermic Pachic Haploxerolls

Typical Pedon

Ignord fine sandy loam, on a slope of less than 1 percent, under a cover of valley oak, yellow starthistle, and annual grasses, at an elevation of 131 feet (40 m). When described on 8/24/1994, the soil was moist at a depth of 4 to 77 inches (10 to 196 cm). (Colors are for dry soil unless otherwise noted.)

Akp—0 to 4 inches (0 to 10 cm); dark grayish brown (10YR 4/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; 10 percent clay; single grain and weak fine and medium granular structure; soft, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine interstitial pores; slightly effervescent; disseminated carbonates; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

Ak1—4 to 14 inches (10 to 36 cm); dark grayish brown (10YR 4/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; 8 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine and fine roots; common very fine interstitial and common very fine and fine and few medium tubular pores; violently effervescent; disseminated carbonates; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

Ak2—14 to 25 inches (36 to 64 cm); dark grayish brown (10YR 4/2) sandy loam, very dark grayish brown (10YR 3/2) moist; 10 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine and fine and few medium roots; common fine interstitial and many very fine and fine tubular pores; violently effervescent; disseminated carbonates; moderately alkaline, pH 8.2 by Hellige-Truog; abrupt smooth boundary.

Ak3—25 to 32 inches (64 to 81 cm); brown (10YR 5/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; 8 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine roots; common fine interstitial pores; violently effervescent; disseminated carbonates; moderately alkaline, pH 8.2 by Hellige-Truog; clear wavy boundary.

Bk—32 to 53 inches (81 to 135 cm); brown (10YR 5/3) sandy loam, brown (10YR 4/3) moist; 8 percent clay; massive; soft, very friable, nonsticky, nonplastic; few very fine roots; common very fine and fine tubular pores; violently effervescent; disseminated carbonates; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

Bkq—53 to 58 inches (135 to 147 cm); brown (10YR 5/3) fine sandy loam, brown (10YR 4/3) moist; 10 percent clay; massive; soft, very friable, nonsticky, nonplastic; few very fine roots; common very fine and fine and few medium tubular pores; 20 percent weakly cemented with silica; violently effervescent; disseminated carbonates; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

Bk´—58 to 77 inches (147 to 196 cm); brown (10YR 5/3) fine sandy loam, brown (10YR 4/3) moist; 10 percent clay; massive; soft, very friable, nonsticky, nonplastic; few very fine and medium roots; many very fine and fine and few medium tubular pores; very slightly effervescent; disseminated carbonates; moderately alkaline, pH 8.0 by Hellige-Truog.

Type location: Butte County, California; about 2 miles west of Chico, approximately 1,400 feet west of the Mt. Diablo meridian and 2,750 feet south of the line separating T. 22 N. and T. 21 N.; in an unsectionized area in the Rancho de Farwell Land Grant; 39 degrees, 42 minutes, 10 seconds north latitude and 121 degrees, 55 minutes, 22 seconds west longitude; NAD27; USGS Quad: Ord Ferry, California.

Range in Characteristics

The thickness of the solum is more than 72 inches (183 cm). The mean annual soil temperature is 60 to 62 degrees F (16 to 17 degrees C). The soil moisture control

section is moist from about December 1 to March 31 (about 110 to 140 days) and is dry in all parts from about May 1 to September 31 (about 150 to 170 days). The particle-size control section averages 8 to 15 percent clay. Mineralogy is mixed. Disseminated lime is at the surface to at least 40 inches (102 cm) below the surface, and the soils are very slightly effervescent to violently effervescent. The content of calcium carbonate ranges from 1 to 4 percent throughout the profile. The content of organic matter is 1 to 4 percent at the surface and decreases regularly with increasing depth. A fluctuating water table can occur below a depth of 72 inches (183 cm) from December through March. Some pedons have a weakly cemented layer within the Bk horizon. This layer is 3 to 8 inches (8 to 20 cm) thick. Silica cementation makes up less than 20 percent of the layer.

The Akp horizon has dry color of 10YR 4/2, 5/2, or 5/3. Moist color is 10YR 2/2, 3/2, or 3/3. The content of clay ranges from 8 to 20 percent. Reaction is slightly alkaline or moderately alkaline.

The Ak horizon has dry color of 10YR 4/2, 5/2, or 5/3. Moist color is 10YR 2/2, 3/2, or 3/3. Texture is fine sandy loam or sandy loam. The content of clay ranges from 8 to 15 percent. Reaction is slightly alkaline or moderately alkaline.

The Bk and Bkq horizons have dry color of 10YR 5/3, 6/2, 6/3, or 6/4. Moist color is 10YR 3/3, 3/4, 4/2, 4/3, or 4/4. Texture is fine sandy loam or sandy loam. The content of clay ranges from 8 to 15 percent. Reaction is slightly alkaline or moderately alkaline.

Igo Series

The Igo series consists of very shallow, somewhat poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are in interfluves on terraces. Slopes range from 0 to 3 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 61 degrees F (16 degree C).

Taxonomic class: Loamy, mixed, superactive, thermic, shallow Typic Durixeralfs

Typical Pedon

Igo gravelly loam, on an east-southeast-facing slope of 1 percent, under a cover of soft chess, grasspink, red brome, filaree, navarretia, brodiaea, and patches of wild oat, at an elevation of 195 feet (59 m). When described on 5/6/1998, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 23 percent clay; moderate thin and medium platy structure; very hard, friable, slightly sticky, slightly plastic; few fine and many very fine roots; common very fine and fine tubular and few medium irregular pores; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—1 to 5 inches (3 to 13 cm); brown (7.5YR 5/4) gravelly clay loam, brown (7.5YR 4/3) moist; 30 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; few fine and common very fine roots; many very fine and fine tubular and common medium tubular and irregular pores; 40 percent discontinuous faint clay films; 20 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt2—5 to 9 inches (13 to 23 cm); brown (7.5YR 5/4) gravelly clay loam, brown (7.5YR 4/3) moist; 34 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; few very fine roots; common fine and many very fine tubular pores; 60 percent discontinuous faint clay films; 25 percent gravel; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

2Bqm—9 inches (23 cm); very strongly cemented duripan; massive; very strongly cemented by silica; 10 percent fine prominent platy manganese coatings at the top of the horizon; 10 percent cobbles and 50 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 0.6 mile southwest of the intersection of Cana Pine Creek Road and Highway 99, approximately 300 feet south and 1,000 feet east of the northwest corner of sec. 4, T. 23 N., R. 1 W.; 39 degrees, 52 minutes, 58 seconds north latitude and 121 degrees, 59 minutes, 24 seconds west longitude; NAD27; USGS Quad: Richardson Springs NW, California.

Range in Characteristics

Depth to the duripan is 4 to 10 inches (10 to 25 cm). The mean annual soil temperature is 62 to 65 degrees F (18 to 22 degrees C). The soil moisture control section is dry in all parts from about May to October (about 180 days). The particle-size control section averages 22 to 35 percent clay and 2 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and a depth of 2 inches (5 to 25 cm) from December through March. Redoximorphic features, such as iron-manganese masses and iron-manganese concretions, can occur throughout the profile. Rock fragments on the surface range from 2 to 50 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 5/4 or 6/4. Moist color is 7.5YR 4/2 or 4/3. Texture is loam, gravelly loam, or gravelly clay loam. The content of clay ranges from 18 to 30 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 4/4, 5/4, or 6/4. Moist color is 7.5YR 3/4 or 4/3 or 5YR 4/3. Texture is loam, gravelly loam, clay loam, or gravelly clay loam. The content of clay ranges from 22 to 36 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. Reaction is neutral.

Islandbar Series

The Islandbar series consists of very deep, somewhat excessively drained soils that formed in residuum and colluvium derived from coarse grained intrusive igneous rocks, mainly trondhjemite and quartz diorite. These soils are on ridgetops and side slopes on granitic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 58 inches (1,473 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Coarse-loamy, mixed, active, mesic Typic Dystroxerepts

Typical Pedon

Islandbar sandy loam, on a northwest-facing slope of 5 percent, under a cover of conifers, hardwoods, and shrubs, at an elevation of 2,220 feet (677 m). When described on 7/22/1998, the soil was dry to a depth of 36 inches (91 cm) and was slightly moist from 36 to 72 inches (91 to 183 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed plant material; abrupt smooth boundary.

A1—2 to 5 inches (5 to 13 cm); light brownish gray (10YR 6/2) sandy loam, dark grayish brown (10YR 4/2) moist; 12 percent clay; weak fine subangular blocky structure parting to weak fine granular; slightly hard, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine and fine irregular pores;

5 percent mica flakes; 5 percent rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

A2—5 to 9 inches (13 to 23 cm); pale brown (10YR 6/3) sandy loam, dark grayish brown (10YR 4/2) moist; 10 percent clay; weak very fine subangular blocky structure parting to weak fine granular; slightly hard, very friable, nonsticky, nonplastic; common very fine and fine roots; common very fine tubular pores; 20 percent mica flakes; 5 percent subrounded gravel; moderately acid, pH 5.8 by Hellige-Truog; abrupt smooth boundary.

Bw1—9 to 27 inches (23 to 69 cm); light yellowish brown (10YR 6/4) sandy loam, brown (10YR 4/3) moist; 5 percent clay; weak very fine subangular blocky structure parting to weak fine granular; slightly hard, very friable, nonsticky, nonplastic; common fine and medium roots; common very fine tubular pores; 25 percent mica flakes; 5 percent subrounded gravel; moderately acid, pH 5.8 by Hellige-Truog; clear smooth boundary.

Bw2—27 to 36 inches (69 to 91 cm); very pale brown (10YR 7/4) sandy loam, yellowish brown (10YR 5/4) moist; 7 percent clay; weak very fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; common fine and medium and few coarse roots; common very fine tubular pores; 30 percent mica flakes; 5 percent subrounded gravel; moderately acid, pH 5.8 by Hellige-Truog; clear smooth boundary.

Bw3—36 to 47 inches (91 to 119 cm); pink (7.5YR 7/4) sandy loam, brown (7.5YR 5/4) moist; 12 percent clay; weak very fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; common fine and medium and few coarse roots; common very fine tubular pores; 35 percent mica flakes; 5 percent subrounded gravel; moderately acid, pH 5.8 by Hellige-Truog; clear smooth boundary.

Bw4—47 to 58 inches (119 to 147 cm); pink (7.5YR 7/4) sandy loam, light brown (7.5YR 6/4) moist; 10 percent clay; weak very fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; common fine and medium roots; common very fine tubular pores; moderately acid, pH 5.8 by Hellige-Truog; gradual wavy boundary.

C1—58 to 62 inches (147 to 157 cm); very pale brown (10YR 8/4) loamy sand, yellowish brown (10YR 5/4) moist; 2 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; common fine roots; many very fine interstitial pores; moderately acid, pH 5.8 by Hellige-Truog; gradual wavy boundary.

C2—62 to 72 inches (157 to 183 cm); extremely gravelly loamy sand; 2 percent clay; massive; very hard, extremely firm, nonsticky, nonplastic; 90 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog.

Type location: Butte County, California; about 2 miles west of Featherfalls, approximately 20 feet west and 1,300 feet south of the northeast corner of sec. 16, T. 20 N., R. 6 E.; 39 degrees, 35 minutes, 47 seconds north latitude and 121 degrees, 17 minutes, 50 seconds west longitude; NAD83; USGS Quad: Forbestown, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 53 to 59 degrees F (12 to 15 degrees C). The particle-size control section averages 5 to 18 percent clay and 0 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 2 percent to a depth of 9 inches (23 cm). Rock fragments on the surface range from 5 to 10 percent gravel. Some pedons do not have a C horizon.

The A horizon has dry color of 10YR 5/2, 5/3, 6/2, 6/3, 6/4, or 7/2. Moist color is 10YR 3/1, 3/2, 4/2, or 4/3. Texture is sandy loam, fine sandy loam, or gravelly sandy loam. The content of clay ranges from 10 to 18 percent. The content of gravel is 5 to 20 percent. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 10YR 6/3, 6/4, 7/2, 7/3, 7/4, 8/3, or 8/4; 7.5YR 7/4; or 2.5Y 7/8 or 8/3. Moist color is 10YR 4/2, 4/3, 4/4, 5/3, 5/4, 6/3, 6/4, 7/4, or 7/6; 7.5YR 5/4, 5/6, 6/4, or 6/6; or 2.5Y 7/8 or 8/3. Texture is sandy loam, fine sandy loam, coarse sandy loam, gravelly sandy loam, or gravelly fine sandy loam. The content of clay ranges from 5 to 18 percent. The content of gravel is 0 to 30 percent. Reaction ranges from strongly acid to neutral.

The C horizon has dry color of 10YR 6/3, 7/3, 7/4, 8/3, or 8/4 or 2.5Y 8/3. Moist color is 10YR 4/3, 4/4, 5/4, 7/4, or 7/6 or 2.5Y 6/3. Texture is loamy sand, gravelly sandy loam, gravelly loamy sand, loamy coarse sand, gravelly loamy coarse sand, very gravelly loamy coarse sand, extremely gravelly loamy sand, or sandy loam. The content of clay ranges from 2 to 18 percent. The content of gravel is 0 to 90 percent. Reaction ranges from strongly acid to neutral.

Jocal Series

The Jocal series consists of very deep, well drained soils that formed in colluvium and residuum derived from soft metasedimentary rocks. These soils are in the Sierra Nevada Mountains. Slopes range from 3 to 75 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Typic Haploxerults

Typical Pedon

Jocal loam. (Colors are for dry soil unless otherwise noted.)

Oi—2 to 0 inches (5 to 0 cm); decomposed needles, twigs, and bark.

A—0 to 4 inches (0 to 10 cm); brown (7.5YR 5/4) loam, dark brown (7.5YR 3/4) moist; moderate fine granular structure; soft, very friable, nonsticky, nonplastic; common very fine and fine roots; many very fine irregular pores; moderately acid; clear smooth boundary.

Bt1—4 to 8 inches (10 to 20 cm); yellowish red (5YR 5/6) loam, yellowish red (5YR 4/6) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky, nonplastic; many very fine and fine roots; many very fine irregular and tubular pores; common thin clay films in pores; moderately acid; clear smooth boundary.

Bt2—8 to 20 inches (20 to 51 cm); reddish yellow (7.5YR 6/6) clay loam, strong brown (7.5YR 5/6) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine and fine roots; common very fine irregular and tubular pores; common thin clay films in pores; moderately acid; clear smooth boundary.

Bt3—20 to 30 inches (51 to 76 cm); reddish yellow (7.5YR 8/6) clay loam, strong brown (7.5YR 5/6) moist; moderate medium subangular blocky structure; slightly hard, very friable, sticky, slightly plastic; common very fine to medium roots; common very fine to medium tubular pores; many thin clay films in pores; strongly acid; clear smooth boundary.

Bt4—30 to 42 inches (76 to 107 cm); reddish yellow (7.5YR 8/6) silty clay loam, strong brown (7.5YR 5/6) moist; weak medium subangular blocky structure; slightly hard, very friable, sticky, slightly plastic; common very fine to medium roots; common very fine to medium tubular pores; common thin clay films in pores; 10 percent saprolitic cobbles and gravel; very strongly acid; abrupt smooth boundary.

Bt5—42 to 59 inches (107 to 150 cm); pink (5YR 7/4) silty clay loam, reddish yellow (5YR 6/6) moist; weak medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine to coarse roots; few very fine and

medium tubular pores; common thin clay films in pores; very strongly acid; clear wavy boundary.

Bt6—59 to 73 inches (150 to 185 cm); mixed pink (5YR 7/4) and light red (2.5YR 6/8) silty clay loam, mixed light reddish brown (5YR 6/4) and red (2.5YR 5/8) moist; massive; soft, very friable, slightly sticky, slightly plastic; few very fine to coarse roots; few very fine and medium tubular pores; few thin clay films in pores; very strongly acid.

Type location: Yuba County, California about 0.45 mile south of Eagleville, approximately 300 feet north and 700 feet west of the southeast corner of sec. 20, T. 20 N., R. 8 E.; 39 degrees, 34 minutes, 18 seconds north latitude and 121 degrees, 5 minutes, 55 seconds west longitude; NAD27; USGS Quad: Strawberry Valley, California.

Range in Characteristics

The depth of the soils is more than 60 inches (152 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July 15 or August 1 to October 15 (about 95 days). Mineralogy is mixed. The content of organic matter is 2 to 5 percent to a depth of 8 inches (20 cm).

The A horizon has dry color of 7.5YR 5/4 or 5YR 5/4 or 4/4. Moist color is 7.5YR 3/4 or 5YR 3/4. Texture is loam. The content of clay ranges from 15 to 27 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 8/6, 6/6, or 4/6 or 5YR 5/6 or 7/4. Moist color is 7.5YR 5/6 or 4/6 or 5YR 4/6, 6/6, or 5/8. Texture is loam, clay loam, or silty clay loam. The content of clay ranges from 27 to 35 percent. Base saturation is 20 to 30 percent. Reaction ranges from very strongly acid to moderately acid.

Jocal Taxadjunct

The Jocal taxadjunct consists of deep, well drained soils that formed in tephra deposited over colluvium and residuum derived from metasediments. These soils are on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 70 inches (1,778 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Fine-loamy, mixed, semiactive, mesic Andic Haploxerults

Typical Pedon

Jocal taxadjunct, on a southwest-facing slope of 35 percent, under a cover of Sierra mixed conifers, at an elevation of 3,600 feet (1,097 m). When described on 6/20/2004, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 3 inches (0 to 8 cm); slightly decomposed plant material consisting of needles, twigs, and cones; abrupt smooth boundary.

A—3 to 4 inches (8 to 10 cm); brown (7.5YR 4/3) gravelly loam, dark brown (7.5YR 3/2) moist; 12 percent clay; moderate very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; few very fine roots; many very fine irregular pores; 20 percent metasedimentary gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.5; abrupt smooth boundary.

Bw—4 to 9 inches (10 to 23 cm); brown (7.5YR 5/4) gravelly loam, brown (7.5YR 4/4) moist; 13 percent clay; moderate very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine and many very fine roots; common very fine and fine tubular pores; 25 percent metasedimentary gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.0; abrupt smooth boundary.

Bt1—9 to 19 inches (23 to 48 cm); strong brown (7.5YR 5/6) gravelly loam, strong brown (7.5YR 4/6) moist; 20 percent clay; moderate fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; common very fine and fine and few medium roots; common very fine and fine tubular pores; 5 percent distinct clay films; 30 percent metasedimentary gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt2—19 to 33 inches (48 to 84 cm); strong brown (7.5YR 5/6) gravelly loam, strong brown (7.5YR 4/6) moist; 25 percent clay; moderate fine subangular blocky structure; soft, friable, nonsticky, slightly plastic; common very fine and fine and common medium roots; common very fine and fine tubular pores; 20 percent distinct clay films; 30 percent metasedimentary gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt3—33 to 46 inches (84 to 117 cm); reddish yellow (7.5YR 7/6) very gravelly clay loam, strong brown (7.5YR 4/6) moist; 27 percent clay; moderate fine and medium subangular blocky structure; soft, friable, slightly sticky, slightly plastic; few fine, common medium, and few coarse roots; few very fine tubular pores; 20 percent distinct clay films; 50 percent metasedimentary gravel; very strongly acid, pH 5.0 by Hellige-Truog; clear smooth boundary.

BCt—46 to 52 inches (117 to 132 cm); pink (7.5YR 7/4) extremely gravelly clay loam, strong brown (7.5YR 4/6) moist; 30 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 10 percent distinct clay films; 75 percent metasedimentary gravel; very strongly acid, pH 4.8 by Hellige-Truog; gradual smooth boundary.

Cr—52 to 68 inches (132 to 173 cm); moderately cemented metasedimentary rock.

Type location: Butte County, California; about 3.5 miles northeast of Clipper Mills, 400 feet west and 1,500 feet south of the northeast corner of sec. 24, T. 20 N., R. 7 E.; 39 degrees, 34 minutes, 49 seconds north latitude and 121 degrees, 7 minutes, 58 seconds west longitude; NAD83; USGS Quad: Clipper Mills, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 47 to 52 degrees F (8 to 11 degrees C). The particle-size control section averages 18 to 30 percent clay and 25 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. Acid-oxalate extractable Al plus ½ Fe ranges from 1.5 to 1.0 percent (by weight). Rock fragments on the surface range from 0 to 15 percent gravel.

The A horizon has dry color of 7.5YR 4/3, 4/6, or 5/4; 5YR 4/6; or 10YR 4/4. Moist color is 7.5YR 3/2, 3/3, or 3/4 or 5YR 3/4. Texture is gravelly loam, gravelly sandy loam, loam, or sandy loam. The content of clay ranges from 9 to 17 percent. The content of gravel is 5 to 20 percent. The content of organic matter is 10 to 14 percent. By sum of cations, base saturation ranges from 15 to 45 percent. NaF pH is 10.5 to 11.8. Reaction ranges from strongly acid to slightly acid.

The Bw horizon has dry color of 7.5YR 4/6, 5/4, or 5/6 or 10YR 5/4 or 6/4. Moist color is 7.5YR 3/3, 3/4, 4/4, or 4/6 or 5YR 3/4. Texture is gravelly loam, gravelly sandy loam, loam, or sandy loam. The content of clay ranges from 10 to 22 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 4 to 8 percent. By sum of cations, base saturation ranges from 10 to 20 percent. NaF pH is 10.5 to 11.8. Reaction ranges from very strongly acid to slightly acid.

The Bt1 and Bt2 horizons have dry color of 7.5YR 5/6 or 10YR 6/4. Moist color is 7.5YR 4/4 or 4/6. Texture is gravelly loam, sandy loam, or clay loam. The content of clay ranges from 15 to 30 percent. The horizons have 0 to 30 percent gravel and 0 to 15 percent cobbles. The content of organic matter is 1 to 3 percent. By sum of

cations, base saturation ranges from 2 to 20 percent. NaF pH is 10.0 to 11.0. Reaction is moderately acid or slightly acid.

The Bt3 horizon has dry color of 7.5YR 6/6 or 7/6 or 10YR 6/6. Moist color is 7.5YR 4/6 or 5/6 or 10YR 5/6. Texture is very gravelly clay loam, very gravelly loam, or very gravelly silt loam. The content of clay ranges from 15 to 30 percent. The horizon has 35 to 50 percent gravel and 0 to 15 percent cobbles. The content of organic matter is 0.3 to 3 percent. By sum of cations, base saturation ranges from 2 to 20 percent. NaF pH is less than 9.8. Reaction ranges from very strongly acid to slightly acid.

The BCt horizon has dry color of 7.5YR 6/4, 6/6, or 7/4 or 10YR 6/6. Moist color is 7.5YR 4/6 or 5/6 or 10YR 5/8. Texture is extremely gravelly clay loam, extremely gravelly silt loam, very gravelly silt loam, very gravelly silty clay loam, or extremely cobbly loam. The content of clay ranges from 15 to 30 percent. The horizon has 0 to 75 percent gravel and 0 to 50 percent cobbles. The content of organic matter is 0.3 to 0.1 percent. By sum of cations, base saturation ranges from 2 to 20 percent. NaF pH is less than 9.8. Reaction ranges from very strongly acid to moderately acid.

The Jocal taxadjunct is a taxadjunct because it has andic soil material at the surface. The difference does not significantly affect the use, management, or interpretations of the soils.

Jokerst Series

The Jokerst series consists of very shallow, poorly drained soils that formed in residuum derived from volcanic mudflow breccia. These soils are in swales and broad planar areas on ridgetops and side slopes on volcanic ridges on Cascade foothills. Slopes range from 0 to 30 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy, mixed, superactive, thermic Lithic Haploxeralfs

Typical Pedon

Jokerst very cobbly loam, on a west-facing slope of 3 percent, under a cover of annual grasses and forbs, at an elevation of 317 feet (97 m). When described on 3/26/1997, the soil was dry from 0 to 1 inch (0 to 2.5 cm) and slightly moist from 1 to 4 inches (2.5 to 10 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); reddish yellow (7.5YR 6/6) very cobbly loam, dark reddish brown (2.5YR 3/4) moist; 15 percent clay; weak medium platy structure parting to moderate fine and medium subangular blocky; moderately hard, firm, slightly sticky, slightly plastic; many very fine roots; few very fine vesicular and tubular pores; noneffervescent; 10 percent gravel, 15 percent cobbles, and 10 percent stones; slightly acid, pH 6.4 by pH meter 1:1 water; clear smooth boundary.

Bt—1 to 4 inches (3 to 10 cm); reddish yellow (5YR 6/6) gravelly loam, dark reddish brown (2.5YR 3/4) moist; 18 percent clay; moderate thin and medium platy structure parting to moderate medium subangular blocky; moderately hard, firm, slightly sticky, slightly plastic; common very fine roots; common very fine vesicular and tubular pores; many faint continuous clay films on faces of peds and on rock fragments; common fine irregular iron-manganese masses between peds; noneffervescent; 15 percent gravel, 10 percent cobbles, and 5 percent stones; slightly acid, pH 6.5 by pH meter 1:1 water; abrupt smooth boundary.

R—4 inches (10 cm); indurated volcanic mudflow breccia; roots matted on top of the bedrock; $^{1}/_{16}$-inch (2-mm) manganese capping.

Type location: Butte County, California; about 0.7 mile north of Rock Creek Road and about 2.8 miles east of Meridian Road, approximately 1,625 feet south and 775

feet west of the northeast corner of sec. 16, T. 23 N., R. 1 E.; 39 degrees, 51 minutes, 3.18 seconds north latitude and 121 degrees, 51 minutes, 54.71 seconds west longitude; NAD83; USGS Quad: Richardson Springs SE, California.

Range in Characteristics

The depth to lithic bedrock is 4 to 10 inches (5 to 25 cm). The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 200 days). The particle-size control section averages 18 to 24 percent clay and 10 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the bedrock and the surface of the soil from November through March. Redoximorphic features occur as iron-manganese masses in the A and Bt horizons, iron-manganese concretions in the Bt horizon, and manganese masses in layers 1/16 to 1/8 inch (2 to 4 mm) thick on top of the bedrock. Rock fragments on the surface range from 0 to 10 percent gravel, 2 to 30 percent cobbles, 3 to 50 percent stones, and 0 to 5 percent boulders. Some pedons have an organic mat, 1/16 inch (2 mm) thick, on the surface.

The A horizon has dry color of 5YR 4/6 or 5/6 or 7.5YR 6/6. Moist color is 2.5YR 3/3 or 3/4; 5YR 3/2, 3/4, or 4/3; or 7.5YR 3/2 or 3/3. Texture is loam, gravelly loam, cobbly loam, stony loam, very cobbly loam, or very stony loam. The content of clay ranges from 12 to 21 percent. The horizon has 10 to 25 percent gravel, 10 to 40 percent cobbles, and 0 to 30 percent stones. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 5YR 5/6 or 6/6 or 7.5YR 6/6. Moist color is 2.5YR 3/3 or 3/4, 5YR 4/3 or 4/4, or 7.5YR 3/3 or 3/4. Texture is loam, gravelly loam, or cobbly loam. The content of clay ranges from 16 to 25 percent. The horizon has 10 to 25 percent gravel, 0 to 20 percent cobbles, and 0 to 10 percent stones. Reaction is slightly acid or neutral.

Katskillhill Series

The Katskillhill series consists of deep, moderately well drained soils that formed in residuum and colluvium derived from metavolcanic rocks, mainly greenschist. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Ultic Palexeralfs

Typical Pedon

Katskillhill loam, on an east-facing slope of 8 percent, under a cover of grasses, forbs, and a trace of blue oak, at an elevation of 720 feet (219 m). When described on 6/6/1999, the soil was dry to a depth of 12 inches (31 cm) and slightly moist from 12 to 42 inches (31 to 107 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 4/4) moist; 12 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine roots; many fine and very fine tubular pores; 20 percent fine irregular yellowish red (5YR 5/6) oxidized iron masses throughout; very strongly acid, pH 5.0 by Hellige-Truog; abrupt smooth boundary.

BAt—2 to 8 inches (5 to 20 cm); yellowish red (5YR 5/6) loam, yellowish red (5YR 4/6) moist; 15 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, nonsticky, slightly plastic; many very fine

roots; many fine and very fine tubular pores; 3 percent faint clay films on vertical faces of peds and on surfaces along root channels; 10 percent subangular greenschist gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—8 to 12 inches (20 to 30 cm); yellowish red (5YR 4/6) very gravelly loam, reddish brown (5YR 4/4) moist; 25 percent clay; moderate medium and fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine roots between peds; many fine, common coarse, and many very fine tubular pores; 15 percent faint clay films on faces of peds; 60 percent subangular greenschist gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

2Bt2—12 to 19 inches (30 to 48 cm); yellowish red (5YR 4/6) clay, yellowish red (5YR 4/6) moist; 46 percent clay; strong coarse prismatic structure parting to strong medium and coarse subangular blocky; extremely hard, extremely firm, very sticky, very plastic; common very fine roots between peds; common fine and very fine tubular pores; 70 percent prominent clay films on faces of peds; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

2Btss1—19 to 29 inches (48 to 74 cm); yellowish red (5YR 5/6) clay, yellowish red (5YR 4/6) moist; 52 percent clay; strong coarse subangular blocky structure; extremely hard, extremely firm, very sticky, very plastic; few very fine roots between peds; few very fine tubular pores; 35 percent prominent slickensides; 70 percent prominent clay films on faces of peds; 10 percent fine spherical manganese concretions; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

2Btss2—29 to 42 inches (74 to 107 cm); yellowish red (5YR 5/6) clay, yellowish red (5YR 4/6) moist; 52 percent clay; strong coarse subangular blocky structure; extremely hard, extremely firm, very sticky, very plastic; few very fine roots between peds; few fine and very fine tubular pores; 15 percent prominent slickensides; 70 percent prominent clay films on faces of peds; 1 percent fine spherical manganese concretions; 10 percent subangular greenschist gravel; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt wavy boundary.

2R—42 inches (107 cm); unweathered, indurated greenschist.

Type location: Butte County, California; about 2.8 miles southeast of Wyandotte, approximately 1,600 feet south and 1,900 feet west of the northeast corner of sec. 5, T. 18 N., R. 5 E.; 39 degrees, 26 minutes, 57.82 seconds north latitude and 121 degrees, 25 minutes, 58.54 seconds west longitude; NAD83; USGS Quad: Bangor, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 35 to 45 percent clay and 10 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. Slickensides range from 15 to 35 percent in the 2Btss horizon. Rock fragments on the surface range from 0 to 3 percent gravel. Some pedons have a BA horizon.

The A horizon has dry color of 7.5YR 5/4 or 5/6 or 10YR 5/4. Moist color is 7.5YR 3/4, 4/3, or 4/4 or 10YR 4/4. Texture is loam. The content of clay ranges from 12 to 18 percent. The content of gravel is 0 to 5 percent. Redoximorphic features, such as soft oxidized iron masses with dry color of 5YR 5/6, can occur in this horizon. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 3 to 9 percent. Reaction ranges from very strongly acid to slightly acid.

The BAt horizon has dry color of 7.5YR 5/6 or 5YR 5/6. Moist color is 5YR 4/4 or 4/6. Texture is loam. The content of clay ranges from 15 to 20 percent. The content of

gravel is 4 to 10 percent. By sum of cations, base saturation ranges from 55 to 73 percent. The content of organic matter is 1 to 4 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 4/6 or 5/6. Moist color is 5YR 4/4 or 4/6. Texture is loam, gravelly loam, or very gravelly loam. The content of clay ranges from 21 to 25 percent. The content of gravel is 5 to 60 percent. By sum of cations, base saturation ranges from 65 to 74 percent. The content of organic matter is 1 to 1.5 percent. Reaction is moderately acid or slightly acid.

The 2Bt horizon has dry color of 5YR 5/6 or 5/8 or 7.5YR 5/4, 5/6, or 6/6. Moist color is 5YR 4/4 or 4/6 or 7.5YR 4/4 or 4/6. Texture is clay loam, clay, or gravelly clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 0 to 20 percent. By sum of cations, base saturation ranges from 75 to 85 percent. The content of organic matter is 0.5 to 1.0 percent. Reaction ranges from very strongly acid to slightly acid.

The 2Btss horizon has dry color of 5YR 5/6, 7.5YR 5/6, or 10YR 6/6. Moist color is 5YR 4/6 or 7.5YR 4/6 or 5/6. Texture is clay. The content of clay ranges from 45 to 55 percent. The content of gravel is 0 to 10 percent. Redoximorphic features, such as manganese concretions, can occur in this horizon. The content of organic matter is 0 to 0.5 percent. Reaction ranges from neutral to moderately alkaline.

Kimball Series

The Kimball series consists of very deep, well drained soils that formed in alluvium derived from igneous and metamorphic rocks. These soils are on low terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, active, thermic Mollic Palexeralfs

Typical Pedon

Kimball loam, on a east-facing slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 100 feet (30 m). (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 2 inches (0 to 5 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/4) moist; 18 percent clay; moderate fine and medium granular structure; soft, friable, nonsticky, nonplastic; many very fine roots; many very fine tubular pores; slightly acid, pH 6.4; abrupt smooth boundary.

Ap2—2 to 4 inches (5 to 10 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/4) moist; 20 percent clay; massive; hard, friable, nonsticky, nonplastic; many very fine roots; many very fine tubular pores; slightly acid, pH 6.3; abrupt wavy boundary.

Ap3—4 to 6 inches (10 to 15 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/4) moist; 21 percent clay; moderate thin platy structure; hard, friable, nonsticky, nonplastic; common very fine roots; many fine tubular pores; slightly acid, pH 6.2; clear smooth boundary.

A—6 to 10 inches (15 to 25 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/4) moist; 23 percent clay; massive; hard, friable, nonsticky, nonplastic; many very fine roots; many fine tubular pores; slightly acid, pH 6.3; clear smooth boundary.

BAt—10 to 17 inches (25 to 43 cm); reddish brown (5YR 4/4) loam, dark reddish brown (5YR 3/4) moist; 25 percent clay; massive; hard, friable, slightly sticky, slightly plastic; common very fine roots; few fine and many very fine tubular pores; 10 percent clay films on surfaces along pores; slightly acid, pH 6.3; abrupt wavy boundary.

2Btss—17 to 34 inches (43 to 86 cm); reddish brown (5YR 4/4) clay, reddish brown (5YR 4/4) moist; 47 percent clay; moderate coarse prismatic structure; extremely

hard, very firm, moderately sticky, very plastic; common very fine roots between peds; common very fine tubular pores; 5 percent slickensides and 80 percent continuous clay films on surfaces along pores, on faces of peds, and as bridges; slightly acid, pH 6.6; gradual wavy boundary.

2Bt—34 to 46 inches (86 to 117 cm); brown (7.5YR 5/4) sandy clay loam, brown (7.5YR 4/4) moist; 33 percent clay; massive; very hard, firm, slightly sticky, slightly plastic; few very fine roots; many very fine tubular pores; 60 percent continuous clay films on surfaces along pores; 1 percent manganese coatings; neutral, pH 7.1; diffuse irregular boundary.

2BC—46 to 64 inches (117 to 163 cm); brown (7.5YR 5/4) sandy clay loam, dark brown (7.5YR 3/4) moist; 30 percent clay; massive; hard, firm, slightly sticky, slightly plastic; few roots; many very fine tubular pores; neutral, pH 6.8.

Type location: Butte County, California; about 2 miles northwest of Honcut, approximately 1,850 feet south and 2,050 feet west of the northeast corner of sec. 7, T. 17 N., R. 4 E.; 39 degrees, 20 minutes, 49 seconds north latitude and 121 degrees, 33 minutes, 46 seconds west longitude; NAD27; USGS Quad: Honcut, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm). The mean annual soil temperature is 61 to 65 degrees F (16 to 18 degrees C). The particle-size control section averages 40 to 45 percent clay and 0 to 10 percent rock fragments, mostly gravel. Mineralogy is mixed.

The Ap and A horizons have dry color of 7.5YR 4/4, 4/6, or 5/4 or 5YR 4/6. Moist color is 7.5YR 3/4 or 5YR 3/4. Texture is loam. The content of clay ranges from 10 to 15 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0.5 to 3 percent. Reaction is slightly acid or neutral.

The BAt horizon has dry color of 5YR 4/4 or 5/6. Moist color is 5YR 3/4 or 4/4. Texture is loam or clay loam. The content of clay ranges from 24 to 30 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0 to 0.5 percent. Reaction is slightly acid or neutral.

The 2Btss horizon has dry color of 5YR 4/4 or 5/4 or 7.5YR 5/4. Moist color is 5YR 4/4 or 7.5YR 4/4. Texture is clay. The content of clay ranges from 40 to 50 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0 to 0.5 percent. Reaction is neutral.

The 2Bt horizon has dry color of 5YR 4/4 or 5/4 or 7.5YR 5/4. Moist color is 5YR 4/4 or 7.5YR 4/4. Texture is sandy clay loam or clay loam. The content of clay ranges from 30 to 40 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0 to 0.5 percent. Reaction is neutral.

The 2BC horizon has dry color of 7.5YR 5/4 or 5YR 5/4. Moist color is 7.5YR 3/4 or 4/4. Texture is sandy clay loam. The content of clay ranges from 27 to 35 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0 to 0.5 percent. Reaction ranges from slightly acid to slightly alkaline.

Kusalslough Series

The Kusalslough series consists of very deep, somewhat poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are on the margins of flood plains and flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (17 degrees C).

Taxonomic class: Fine, mixed, superactive, nonacid, thermic Oxyaquic Xerofluvents

Typical Pedon

Kusalslough silty clay loam, on a slope of less than 1 percent, in a walnut orchard, at an elevation of 127 feet (39 m). When described on 5/24/1994, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 4 inches (0 to 10 cm); pale brown (10YR 6/3) silty clay loam, dark grayish brown (10YR 4/2) moist; 31 percent clay; strong very thick platy structure parting to strong thin and medium platy; hard, firm, slightly sticky, slightly plastic; few very fine roots; few very fine and fine tubular pores; moderately acid, pH 5.6 by Hellige-Truog; clear smooth boundary.

Ap2—4 to 12 inches (10 to 30 cm); pale brown (10YR 6/3) silty clay loam, dark grayish brown (10YR 4/2) moist; 32 percent clay; moderate coarse subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few very fine to coarse roots; common fine and medium tubular pores; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bw—12 to 21 inches (30 to 53 cm); pale brown (10YR 6/3) and brown (10YR 5/3) silty clay loam, brown (10YR 4/3) and dark grayish brown (10YR 4/2) moist; 35 percent clay; moderate medium and coarse subangular blocky structure; soft, very friable, moderately sticky, moderately plastic; few medium and coarse and common very coarse roots; many very fine and common fine tubular pores; neutral, pH 6.8 by Hellige-Truog; gradual smooth boundary.

Ab—21 to 31 inches (53 to 79 cm); grayish brown (10YR 5/2) silty clay loam, dark grayish brown (10YR 4/2) moist; 37 percent clay; moderate medium and coarse subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few medium, common coarse, and many very coarse roots; common fine and medium tubular pores; common fine distinct brown (7.5YR 4/4 moist) irregularly shaped oxidized iron masses; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bwb1—31 to 41 inches (79 to 104 cm); brown (10YR 5/3) silty clay loam, dark grayish brown (10YR 4/2) moist; 35 percent clay; moderate medium and coarse subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few fine and common coarse and very coarse roots; common fine and medium tubular pores; common fine distinct brown (7.5YR 4/4 moist) irregularly shaped oxidized iron masses; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt smooth boundary.

Bwb2—41 to 57 inches (104 to 145 cm); grayish brown (10YR 5/2) silty clay, dark grayish brown (10YR 4/2) moist; 45 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, very sticky, very plastic; few fine to very coarse roots; common fine tubular pores; few fine distinct reddish brown (5YR 4/4 moist) irregularly shaped oxidized iron masses; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bwb3—57 to 69 inches (145 to 175 cm); grayish brown (10YR 5/2) silty clay, dark grayish brown (10YR 4/2) moist; 53 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, very sticky, very plastic; few medium roots; few fine and medium tubular pores; slightly alkaline, pH 7.5 by Hellige-Truog; gradual wavy boundary.

Bwb4—69 to 80 inches (175 to 203 cm); grayish brown (10YR 5/2) silty clay, brown (10YR 4/3) moist; 49 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, very sticky, very plastic; few fine tubular pores; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 4 miles west of Chico, approximately 4,625 feet west of Mt. Diablo base meridian and 200 feet south of Grape Way; in an unsectionized area in the Arroyo Chico Land Grant; 39 degrees, 43 minutes, 2

seconds north latitude and 121 degrees, 56 minutes, 5 seconds west longitude; NAD27; USGS Quad: Ord Ferry, California.

Range in Characteristics

The thickness of the solum is more than 60 inches (152 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May 1 to October 31 (about 170 to 190 days) and moist in all parts from about January 1 to March 31. The particle-size control section averages 35 to 40 percent clay and 50 to 60 percent silt. Mineralogy is mixed. A fluctuating water table can occur at a depth of 14 to 72 inches (36 to 183 cm) from December through May. Redoximorphic features, such as soft oxidized iron masses with color of 7.5YR 4/6 or 4/4 or 5YR 4/4 moist, occur in the Bw, Ab, and Bwb horizons.

The Ap horizon has dry color of 10YR 6/2 or 6/3. Moist color is 10YR 4/2 or 4/3. Texture is silty clay loam. The content of clay ranges from 28 to 35 percent. The content of organic matter is 1 to 4 percent. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 10YR 5/2, 5/3, or 6/3. Moist color is 10YR 3/3, 4/2, or 4/3. Texture is clay loam or silty clay loam. The content of clay ranges from 30 to 40 percent. The content of organic matter is 0.5 to 2 percent. Reaction is neutral or slightly alkaline.

The Ab horizon has dry color of 10YR 4/2, 4/3, or 5/2. Moist color is 10YR 3/1, 3/2, 3/3, or 4/2. Texture is clay loam or silty clay loam. The content of clay ranges from 30 to 40 percent. The content of organic matter is 1 to 3 percent. Reaction is neutral or slightly alkaline.

The Bwb horizon has dry color of 10YR 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 3/3, 3/4, 4/2, 4/3, or 4/4. Texture is silty clay loam or clay loam in the upper part of the horizon and clay or silty clay in the lower part. The content of clay ranges from 35 to 55 percent. The content of organic matter is 0.1 to 2 percent. Reaction is neutral or slightly alkaline.

Lavatop Series

The Lavatop series consists of moderately deep, well drained soils that formed in mixed tephra, residuum, and colluvium derived from Lovejoy basalt. These soils are on the tops and side slopes of basalt ridges on volcanic Sierra Nevada mountains. Slopes range from 0 to 30 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Medial-skeletal, amorphic, mesic Humic Haploxerands

Typical Pedon

Lavatop gravelly medial fine sandy loam, on a south-facing slope of 2 percent, under a cover of greenleaf manzanita, ponderosa pine, and California black oak, at an elevation of 4,210 feet (1,283 m). When described on 6/19/1995, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1.27 cm); litter of pine needles, leaves, cones, and twigs.

A—0.5 inch to 4 inches (1.27 to 9 cm); dark brown (10YR 3/3) gravelly medial fine sandy loam, very dark grayish brown (10YR 3/2) moist; 18 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; many fine and medium and few very fine roots; many very fine irregular pores; noneffervescent; 25 percent subangular basalt gravel; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.6; clear smooth boundary.

Bw1—4 to 15 inches (9 to 41 cm); brown (10YR 4/3) very gravelly medial sandy loam, very dark grayish brown (10YR 3/2) moist; 20 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, slightly plastic; many fine and medium and few coarse and very coarse roots; many very fine irregular pores; noneffervescent; 40 percent subangular basalt gravel; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 10.9; clear smooth boundary.

Bw2—15 to 26 inches (41 to 66 cm); dark yellowish brown (10YR 4/4) extremely gravelly medial sandy loam, dark brown (10YR 3/3) moist; 18 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, slightly plastic; many medium roots; many very fine irregular pores; noneffervescent; 30 percent subangular basalt gravel and 50 percent subangular basalt cobbles; strongly acid, pH by 5.3 by pH meter 1:1 water; NaF pH 10.6; abrupt smooth boundary.

R—26 inches (66 cm); fractured, indurated basalt.

Type location: Butte County, California; about 6.1 miles east of Camp Eighteen, approximately 1,250 feet east and 250 feet north of the southwest corner of sec. 36, T. 21 N., R. 7 E.; 39 degrees, 37 minutes, 45.8 seconds north latitude and 121 degrees, 8 minutes, 54 seconds west longitude; NAD27; USGS Quad: Cascade, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 47 to 54 degrees F (11 to 12 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 18 to 20 percent clay and 45 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is amorphic. By ammonium acetate, base saturation ranges from 9 to 23 percent to a depth of 25.5 inches (66 cm). By ammonium acetate, CEC ranges from 36 to 40 to a depth of 25.5 inches (66 cm). Acid oxalate extractable Al plus ½ Fe ranges from 2.9 to 3.7 to a depth of 25.5 inches (66 cm). P retention ranges from 85 to 96 to a depth of 25.5 inches (66 cm). Rock fragments on the surface range from 5 to 30 percent gravel, 0 to 40 percent cobbles, and 0 to 30 percent stones.

The A horizon has dry color of 10YR 3/3. Moist color is 10YR 3/2. Texture generally is gravelly medial fine sandy loam, but in some pedons it is extremely gravelly medial fine sandy loam, extremely cobbly medial fine sandy loam, medial loam, or gravelly medial loam. The content of clay ranges from 18 to 20 percent. The horizon has 10 to 40 percent gravel and 0 to 40 percent cobbles. The content of organic matter is 10 to 15 percent. NaF pH is 10.5 to 11.0. Reaction is strongly acid or moderately acid.

The Bw horizon has dry color of 10YR 4/3 or 4/4. Moist color is 10YR 3/2, 3/3, or 4/2. Texture is very gravelly medial sandy loam, extremely gravelly medial sandy loam, extremely cobbly medial sandy loam, or extremely stony medial fine sandy loam. The content of clay ranges from 18 to 20 percent. The horizon has 30 to 40 percent gravel, 0 to 50 percent cobbles, 0 to 35 percent stones, and 0 to 25 percent boulders. The content of organic matter is 5 to 12 percent. NaF pH is 10.5 to 11.0. Reaction is strongly acid.

Lewisflat Series

The Lewisflat series consists of very deep, well drained soils that formed in tephra over residuum and colluvium weathered from quartz diorite. These soils are on side slopes on granitic Sierra Nevada mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Fine-loamy, mixed, semiactive, mesic Andic Haploxerults

Typical Pedon

Lewisflat loam, on a northeast-facing slope of 3 percent, under a cover of mixed conifers, at an elevation of 3,675 feet (1,120 m). When described on 11/1/1995, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 3 inches (0 to 8 cm); litter of needles, cones, and twigs.

A1—3 to 5 inches (8 to 13 cm); brown (10YR 4/3) loam, brown (7.5YR 4/3) moist; 14 percent clay; moderate medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; many very fine roots; few very fine tubular pores; noneffervescent; 10 percent rounded gravel; strongly acid, pH 5.2 by pH meter 1:1 water; NaF pH 10.8; abrupt smooth boundary.

A2—5 to 9 inches (13 to 23 cm); strong brown (7.5YR 5/6) loam, brown (7.5YR 4/4) moist; 17 percent clay; moderate medium subangular blocky structure; slightly hard, firm, nonsticky, slightly plastic; common very fine and fine roots; common very fine tubular pores; noneffervescent; 5 percent rounded gravel; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.2; abrupt smooth boundary.

Bt1—9 to 18 inches (23 to 46 cm); strong brown (7.5YR 5/6) loam, strong brown (7.5YR 5/6) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, friable, nonsticky, moderately plastic; common very fine and fine roots; common very fine tubular pores; few clay films on faces of peds and in pores; noneffervescent; 5 percent rounded gravel; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 9.7; clear smooth boundary.

2Bt2—18 to 33 inches (46 to 84 cm); reddish yellow (7.5YR 6/6) loam, strong brown (7.5YR 5/6) moist; 24 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine and fine and few medium and coarse roots; common very fine tubular pores; common clay films on faces of peds and in pores; noneffervescent; 2 percent subrounded gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.4; clear smooth boundary.

2Bt3—33 to 49 inches (84 to 125 cm); reddish yellow (7.5YR 6/6) loam, strong brown (7.5YR 5/6) moist; 19 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common fine and medium and few coarse roots; few very fine tubular pores; few clay films on faces of peds and in pores; noneffervescent; strongly acid, pH 5.1 by pH meter 1:1 water; NaF pH 9.5; clear smooth boundary.

2BCt1—49 to 65 inches (125 to 165 cm); reddish yellow (7.5YR 7/6) loam, strong brown (7.5YR 5/6) moist; 12 percent clay; moderate medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common fine and medium and few coarse roots; few very fine tubular pores; few clay films on faces of peds and in pores; noneffervescent; strongly acid, pH 5.1 by pH meter 1:1 water; gradual smooth boundary.

2BCt2—65 to 75 inches (165 to 190 cm); reddish yellow (7.5YR 7/6) loam, reddish yellow (7.5YR 6/6) moist; 12 percent clay; weak medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; few fine and medium roots; few very fine tubular pores; few clay films in root channels and pores; very strongly acid, pH 5.0 by pH meter 1:1 water.

Type location: Butte County, California; about 1.1 miles north of Strawberry Valley, approximately 1,400 feet east and 2,000 feet south of the northwest corner of sec. 20, T. 20 N., R. 8 E.; 39 degrees, 34 minutes, 47.5 seconds north latitude and 121 degrees, 6 minutes, 37.5 seconds west longitude; NAD27; USGS Quad: Strawberry Valley, California.

Range in Characteristics

The depth to paralithic bedrock (quartz diorite) is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 56 degrees F (11 to 13 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 1 (about 90 to 110 days) The particle-size control section averages 18 to 27 percent clay and 0 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 8 to 10 percent to a depth of 2 inches (5 cm), 1 to 2 percent from 2 to 15 inches (5 to 38 cm), and less than 0.6 percent from 15 to 72 inches (38 to 183 cm). By sum of cations, base saturation ranges from 9 to 32 percent in the argillic horizon. Acid oxalate extractable Al plus ½ Fe is 1 to 2 to a depth of 18 inches (46 cm). Rock fragments on the surface range from 0 to 10 percent gravel. Some pedons have a 2Bw or 2C horizon below the argillic horizon.

The A horizon has dry color of 7.5YR 4/2, 5/4, 5/6, 6/4, or 6/6 or 10YR 4/3 or 6/3. Moist color is 7.5YR 3/2, 3/3, 3/4, 4/3, 4/4, or 4/6 or 10YR 5/4. Texture is dominantly loam, but in some pedons it is sandy loam or coarse sandy loam. The content of clay ranges from 5 to 18 percent. The content of gravel is 5 to 10 percent. NaF pH is 10.0 to 11.5. Reaction ranges from strongly acid to slightly acid.

The Bt horizon has dry color of 7.5YR 5/6, 6/4, 6/6, 7/4, or 7/6 or 5YR 5/6. Moist color is 7.5YR 4/4, 4/6, 5/4, 5/6, 5/8, or 6/8; 5YR 4/4, 5/6, or 5/8; or 10YR 5/4 or 5/6. Texture is loam, gravelly loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 18 to 27 percent. The content of gravel is 0 to 20 percent. NaF pH is 9.7 to 10.0. Reaction is strongly acid or moderately acid.

The 2Bt horizon has dry color of 7.5YR 5/6, 6/4, 6/6, 7/4, or 7/6 or 5YR 5/6. Moist color is 7.5YR 4/4, 4/6, 5/4, 5/6, 5/8, or 6/8; 5YR 4/4, 5/6, or 5/8; or 10YR 5/4 or 5/6. Texture is loam, gravelly loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 18 to 27 percent. The content of gravel is 0 to 20 percent. NaF pH is 9.4 to 9.0. Reaction is strongly acid or moderately acid.

The 2BCt horizon has dry color of 7.5YR 6/6 or 7/6. Moist color is 7.5YR 5/6, 6/6, 5/8, or 6/8 or 10YR 5/6, 6/6, or 7/6. Texture is loam, gravelly loam, sandy clay loam, sandy loam, gravelly sandy loam, or fine sandy loam. The content of clay ranges from 8 to 27 percent. The content of gravel is 0 to 20 percent. NaF pH is 9.0 to 9.5. Reaction ranges from very strongly acid to moderately acid.

The 2Bw horizon, where it occurs, has dry color of 7.5YR 6/6 or 7/6. Moist color is 7.5YR 5/6, 6/6, 5/8, or 6/8 or 10YR 5/6, 6/6, or 7/6. Texture is loam or sandy loam. The content of clay ranges from 8 to 18 percent. The content of gravel is 0 to 15 percent. NaF pH is 9.0 to 9.5. Reaction ranges from very strongly acid to moderately acid.

The 2C horizon, where it occurs, has dry color of 7.5YR 6/6 or 7/6. Moist color is 7.5YR 5/6, 6/6, 5/8, or 6/8 or 10YR 5/6, 6/6, or 7/6. Texture is loam or sandy loam. The content of clay ranges from 8 to 18 percent. The content of gravel is 0 to 15 percent. NaF pH is 9.0 to 9.5. Reaction ranges from very strongly acid to moderately acid.

Lithic Xerorthents

Lithic Xerorthents consist of very shallow, somewhat excessively drained soils that formed in residuum derived from quartz diorite. These soils are on ridgetops and side slopes on granitic Sierra Nevada mountains. Slopes range from 12 to 70 percent. The mean annual precipitation is about 55 inches (1,397 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Loamy, mixed, active, nonacid, mesic Lithic Xerorthents

Typical Pedon

Lithic Xerorthents gravelly sandy loam, on a southwest-facing slope of 42 percent, under a cover of canyon live oak, whiteleaf manzanita, California black oak, and scattered conifers, at an elevation of 2,690 feet (807 m). When described on 9/7/2000, the soil was slightly moist to a depth of 2 inches (5 cm) and dry from 2 to 8 inches (5 to 20 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed plant material; abrupt smooth boundary.

A—2 to 4 inches (5 to 10 cm); very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 4/3) moist; 6 percent clay; single grain; loose, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine irregular pores; 20 percent subrounded quartz diorite gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bw—4 to 8 inches (10 to 20 cm); light yellowish brown (10YR 6/4) sandy loam, dark yellowish brown (10YR 4/4) moist; 8 percent clay; single grain; loose, very friable, nonsticky, nonplastic; many fine and medium and many coarse roots; many very fine irregular pores; 10 percent subrounded quartz diorite gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

R—8 inches (20 cm); indurated quartz diorite bedrock.

Type location: Butte County, California; about 1.2 miles northeast of Berry Creek, approximately 2,700 feet east and 700 feet south of the northwest corner of sec. 26, T. 21 N., R. 5 E.; 39 degrees, 39 minutes, 11 seconds north latitude and 121 degrees, 23 minutes, 4 seconds west longitude; NAD83; USGS Quad: Berry Creek, California.

Range in Characteristics

The depth to lithic bedrock is 1 to 10 inches (3 to 25 cm). The mean annual soil temperature is 47 to 59 degrees F (8 to 15 degrees C). The particle-size control section averages 6 to 8 percent clay and 10 to 20 percent rock fragments, mostly fine gravel. Mineralogy is mixed. Rock fragments on the surface range from 15 to 50 percent gravel, 0 to 30 percent cobbles, 0 to 50 percent stones, and 0 to 50 percent boulders.

The A horizon has dry color of 10YR 6/2, 6/3, or 7/3. Moist color is 10YR 4/2 or 4/3. Texture is gravelly sandy loam or sandy loam. The content of clay ranges from 6 to 8 percent. The content of gravel is 5 to 35 percent. The content of organic matter is 1 to 5 percent. By ammonium acetate, base saturation ranges from 60 to 70 percent. Reaction is strongly acid or moderately acid.

The Bw horizon has dry color of 10YR 6/6, 6/4, 7/3, or 8/2. Moist color is 10YR 4/3, 4/4, 5/3, or 6/4. Texture is sandy loam, coarse sandy loam, or gravelly sandy loam. The content of clay ranges from 6 to 10 percent. The content of gravel is 10 to 35 percent. The content of organic matter is 0.1 to 1.5 percent. By ammonium acetate, base saturation ranges from 50 to 60 percent. Reaction is strongly acid or moderately acid.

Liveoak Series

The Liveoak series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are in distributary channels on stream terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Haploxerolls

Typical Pedon

Liveoak sandy loam, on a slope of 0 to 2 percent, under a cover of prune trees, at an elevation of 95 feet (29 m). (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 4 inches (0 to 10 cm); yellowish brown (10YR 5/4) sandy loam, dark brown (10YR 3/3) moist; 16 percent clay; moderate thick platy structure parting to moderate coarse subangular blocky; soft, very friable, slightly sticky, nonplastic; common very fine roots; many very fine irregular and few very fine vesicular pores; 2 percent gravel; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Ap2—4 to 17 inches (10 to 43 cm); yellowish brown (10YR 5/4) sandy loam, dark brown (10YR 3/3) moist; 18 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky, nonplastic; common very fine and few fine and medium roots; common very fine irregular, many very fine tubular, and few very fine vesicular pores; 2 percent gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bw1—17 to 37 inches (43 to 94 cm); yellowish brown (10YR 5/4) sandy loam, dark yellowish brown (10YR 3/4) moist; 18 percent clay; moderate medium subangular blocky structure; soft, very friable, slightly sticky, nonplastic; few very fine and fine roots; many very fine irregular, common very fine and fine tubular, and few very fine and fine vesicular pores; faint patchy clay bridges between sand grains; 2 percent gravel; neutral, pH 6.9 by Hellige-Truog; gradual smooth boundary.

Bw2—37 to 48 inches (94 to 122 cm); yellowish brown (10YR 5/4) sandy loam, dark yellowish brown (10YR 3/4) moist; 20 percent clay; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky, nonplastic; few very fine and fine roots; many very fine irregular, common very fine and fine tubular, and few very fine and fine vesicular pores; 2 percent gravel; neutral, pH 6.9 by Hellige-Truog; gradual smooth boundary.

C1—48 to 61 inches (122 to 155 cm); yellowish brown (10YR 5/4) sandy loam, dark yellowish brown (10YR 3/4) moist; 12 percent clay; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky, nonplastic; few very fine roots; many very fine irregular, common very fine and fine tubular, and few very fine and fine vesicular pores; common fine faint dark grayish brown (10YR 4/2) irregularly shaped iron depletions on surfaces of root channels; 8 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

C2—61 to 71 inches (155 to 180 cm); yellowish brown (10YR 5/4) loamy sand, dark yellowish brown (10YR 3/4) moist; 6 percent clay; weak fine and medium subangular blocky structure; loose, nonsticky, nonplastic; few very fine roots; many very fine irregular pores; common fine faint dark grayish brown (10YR 4/2) irregularly shaped iron depletions on surfaces of root channels; 10 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

C3—71 to 75 inches (180 to 190 cm); yellowish brown (10YR 5/4) gravelly loamy sand, dark brown (10YR 3/3) moist; 5 percent clay; single grain; loose, nonsticky, nonplastic; many very fine irregular pores; 18 percent gravel; neutral, pH 6.8 by Hellige-Truog.

Type location: Butte County, California; about 0.25 mile east of Gridley, approximately 1,550 feet north and 2,960 feet east of the southeast corner of sec. 36, T. 18 N., R. 2 E.; in an unsectionized area in the Boga Land Grant; 39 degrees, 22 minutes, 03 seconds north latitude and 121 degrees, 40 minutes, 36 seconds west longitude; NAD27; USGS Quad: Gridley, California.

Range in Characteristics

The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from June 15 to October 31 (about 138 days). The particle-size control section averages 18 to 25 percent clay. Mineralogy is mixed. The

content of organic matter is 2 to 3 percent to a depth of 17 inches (43 cm), 1 to 2 percent from 17 to 61 inches (43 to 155 cm), and 0.5 to 1 percent from 61 to 80 inches (155 to 203 cm). Redoximorphic features, such as iron depletions that are along root channels and have color of 10YR 4/2, occur below a depth of 40 inches (102 cm) in some pedons. A fluctuating water table can occur at a depth of 11 to 65 inches (28 to 165 cm) from December through April.

The Ap horizon has dry color of 10YR 5/4, 5/3, 4/4, or 3/4. Moist color is 10YR 3/3 or 3/2. Texture is sandy loam or sandy clay loam. The content of clay ranges from 16 to 25 percent. The content of rock fragments, mostly gravel, ranges from 0 to 5 percent. Reaction is slightly acid or neutral.

The Bw horizon has dry color of 10YR 5/4, 5/3, 4/4, or 3/4. Moist color is 10YR 3/3 or 3/2. Texture is sandy loam or sandy clay loam. The content of clay ranges from 18 to 25 percent. The content of rock fragments, mostly gravel, ranges from 0 to 10 percent. Reaction is neutral.

The C horizon has dry color of 10YR 5/4 or 6/4. Moist color is 10YR 4/4, 4/3, or 3/3. Texture is gravelly loamy sand, gravelly sandy loam, loamy sand, or sandy loam. The content of clay ranges from 5 to 19 percent. The content of rock fragments, mostly gravel, ranges from 0 to 20 percent. Reaction is neutral.

Liveoak Taxadjunct

The Liveoak taxadjunct consists of deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on mounds on remnant terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 16 inches (406 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Calcixerepts

Typical Pedon

Liveoak taxadjunct loam, under a cover of annual grasses and tules, at an elevation of 55 feet (17 m). (Colors are for dry soil unless otherwise noted.)

Ak—0 to 6 inches (0 to 15 cm); light brownish gray (10YR 6/2) loam, very dark grayish brown (10YR 3/2) moist; moderate fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many medium and fine roots; many very fine and fine tubular pores; disseminated lime; 11 percent calcium carbonate equivalent; strongly effervescent; moderately alkaline; clear smooth boundary.

Bk1—6 to 16 inches (15 to 41 cm); pale brown (10YR 6/3) loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine and fine tubular pores; disseminated lime; violently effervescent; 21 percent calcium carbonate equivalent; moderately alkaline; clear wavy boundary.

Bk2—16 to 30 inches (41 to 76 cm); pale brown (10YR 6/3) loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; soft, friable, slightly sticky, slightly plastic; common very fine roots; disseminated lime; 26 percent calcium carbonate equivalent; many coarse and very coarse rounded siliceous and calcareous concretions; violently effervescent; moderately alkaline; clear irregular boundary.

Bkq—30 to 39 inches (76 to 99 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; massive; soft, friable, slightly sticky, slightly plastic; common very fine roots; common very fine and fine tubular pores; disseminated lime; 29 percent calcium carbonate equivalent; many medium rounded siliceous and calcareous concretions; violently effervescent; moderately alkaline; clear irregular boundary.

B´k3—39 to 54 inches (99 to 137 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; massive; soft, friable, slightly sticky, slightly plastic; few very fine roots; many very fine tubular pores; disseminated lime and many fine seams of lime; 27 percent calcium carbonate equivalent; violently effervescent; moderately alkaline; abrupt smooth boundary.

Bkqm—54 to 63 inches (137 to 160 cm); brown (10YR 5/3), indurated duripan, dark brown (10YR 3/3) moist; massive; extremely hard; continuous and indurated with silica and lime; violently effervescent; disseminated lime; abrupt smooth boundary.

2C—63 inches (160 cm); pale brown (10YR 6/3) very fine sandy loam, brown (10YR 4/3) moist; loose, nonsticky, nonplastic; neutral.

Type location: Sutter County, California; about 4.7 miles west of Pennington, approximately 2,800 feet east and 320 feet south of the northwest corner of sec. 32, T. 17 N., R. 1 E.; 39 degrees, 17 minutes, 18 seconds north latitude and 121 degrees, 52 minutes, 52 seconds west longitude; NAD27; USGS Quad: Sanborn Slough, California.

Range in Characteristics

Depth to the duripan ranges from 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 65 degrees F (17 to 18 degrees C). The particle-size control section ranges from 18 to 25 percent clay. Mineralogy is mixed. The soils are calcareous throughout. The content of organic matter is less than 1 percent throughout the profile. A fluctuating water table can occur at a depth of 48 to 60 inches (122 to 152 cm) from December through April.

The Ak horizon has dry color of 10YR 6/2, 7/2, or 6/3. Moist color is 10YR 3/2, 4/2, 3/3, or 4/3. Texture is loam. The content of clay ranges from 18 to 25 percent. Reaction is moderately alkaline.

The Bk horizon has dry color of 10YR 5/3, 6/2, 6/3, 6/4, or 7/3. Moist color is 10YR 3/2, 3/3, or 4/3. Texture is loam. The content of clay ranges from 18 to 25 percent. Reaction is moderately alkaline.

The Liveoak taxadjunct is a taxadjunct because it has a duripan between depths of 40 and 60 inches. This difference does not significantly affect the use, management, or interpretations of the soils.

Llanoseco Series

The Llanoseco series consists of very deep, somewhat poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in flood basins. Slopes range from 0 to 2 percent. The mean annual precipitation is about 18 (457 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Chromic Haploxererts

Typical Pedon

Llanoseco silty clay loam, on a slope of less than 1 percent, under a cover of annual grasses, at an elevation of 107 feet (33 m). When described on 5/10/1995, the soil was slightly moist below a depth of 18 inches (46 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 8 inches (0 to 20 cm); pale brown (10YR 6/3) silty clay loam, dark grayish brown (10YR 4/2) moist; 33 percent clay; moderate fine subangular blocky structure; soft, friable, slightly sticky, moderately plastic; many very fine and few fine roots; common very fine tubular pores; moderately acid, pH 6.0 by pH meter 1:1 water; abrupt smooth boundary.

2A—8 to 18 inches (20 to 46 cm); grayish brown (10YR 5/2) silty clay loam, very dark grayish brown (10YR 3/2) moist; 38 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; slightly hard, friable, moderately sticky, moderately plastic; few fine roots; common very fine tubular pores; neutral, pH 6.6 by pH meter 1:1 water; clear smooth boundary.

3Bss1—18 to 28 inches (46 to 71 cm); brown (10YR 5/3) silty clay, dark grayish brown (10YR 4/2) moist; 42 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; slightly hard, friable, moderately sticky, very plastic; very few very fine roots; common very fine tubular pores; common slickensides; slightly alkaline, pH 7.4 by pH meter 1:1 water; gradual smooth boundary.

3Bss2—28 to 41 inches (71 to 104 cm); brown (10YR 5/3) silty clay, dark grayish brown (10YR 4/2) moist; 42 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; slightly hard, friable, moderately sticky, very plastic; very few very fine roots; common very fine tubular pores; common slickensides; slightly alkaline, pH 7.7 by pH meter 1:1 water; gradual smooth boundary.

3Bss3—41 to 57 inches (104 to 145 cm); brown (10YR 5/3) silty clay, dark grayish brown (10YR 4/2) moist; 43 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; very hard, firm, moderately sticky, very plastic; very few very fine roots; few very fine tubular pores; common very fine and fine gray (10YR 5/1 moist) irregular iron depletions lining pores; common slickensides; slightly alkaline, pH 7.8 by pH meter 1:1 water; clear smooth boundary.

3Bss4—57 to 71 inches (145 to 180 cm); brown (10YR 5/3) silty clay, dark grayish brown (10YR 4/2) moist; 43 percent clay; moderate medium angular blocky structure; very hard, firm, moderately sticky, very plastic; very few very fine roots; common very fine tubular pores; common slickensides; moderately alkaline, pH 8.2 by pH meter 1:1 water; clear smooth boundary.

3Bk1—71 to 85 inches (180 to 216 cm); pale brown (10YR 6/3) silty clay, brown (10YR 4/3) moist; 43 percent clay; moderate fine angular blocky structure; hard, friable, moderately sticky, very plastic; common very fine tubular pores; 2 percent calcium carbonate; strongly alkaline, pH 8.5 by pH meter 1:1 water; clear smooth boundary.

3Bk2—85 to 91 inches (216 to 231 cm); yellowish brown (10YR 5/4) silty clay, dark yellowish brown (10YR 4/4) moist; moderate fine angular blocky structure; hard, very friable, moderately sticky, very plastic; common very fine tubular pores; strongly effervescent; 2 percent calcium carbonate; strongly alkaline, pH 8.5 by pH meter 1:1 water; abrupt wavy boundary.

4Bkqm—91 to 93 inches (231 to 236 cm); pink (7.5YR 8/4), indurated duripan, reddish yellow (7.5YR 6/6) moist; massive parting to platy; silica- and lime-cemented capping 1/8 inch thick; strongly effervescent; 49 percent calcium carbonate.

Type location: Butte County, California; about 5.5 miles southwest of Dayton, approximately 20,370 feet north and 700 feet east of the northwest corner of sec. 2, T. 19 N., R. 1 W.; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 35 minutes, 32 seconds north latitude and 121 degrees, 56 minutes, 43 seconds west longitude; NAD27; USGS Quad: Llano Seco, California.

Range in Characteristics

Depth to the duripan ranges from 60 to 120 inches (152 to 305 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from May to October 15 (about 165 days). The particle-size control section ranges from 40 to 50 percent clay. Mineralogy is smectitic. The content of organic matter is 1 to 3 percent to a depth of 28 inches (71 cm) and 0.1 to 0.5

percent from 28 to 91 inches (71 to 231 cm). By ammonium acetate, base saturation ranges from 93 to 100 percent throughout the profile. Reversible, surface-initiated cracks 1/2 to 1 inch (12.7 to 25.4 mm) wide extend to a depth of 40 to 60 inches (102 to 152 cm) from May to October (165 days) when the soils are not irrigated. Few or common slickensides occur in the 3Bss horizons, from 18 to 71 inches (46 to 180 cm). A fluctuating water table can occur between the top of the duripan and 54 inches (137 cm) below the surface of the soil from December through March. Some pedons have redoximorphic features, such as manganese or oxidized iron masses, below a depth of 40 inches (102 cm).

The Ap horizon has dry color of 10YR 6/3, 6/2, or 5/2. Moist color is 10YR 4/2 or 4/3. The content of clay ranges from 27 to 35 percent. Reaction is moderately acid or slightly acid.

The 2A horizon has dry color of 10YR 6/2, 5/2, or 5/3. Moist color is 10YR 4/2, 3/2, or 4/3. The content of clay ranges from 35 to 40 percent. Reaction is slightly acid or neutral.

The 3Bss horizon has dry color of 10YR 6/3 or 5/3. Moist color is 4/3, 4/2, or 3/3. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. Reaction ranges from neutral to strongly alkaline.

The 3Bk horizon has dry color of 10YR 5/4 or 6/3. Moist color is 10YR 4/3 or 4/4. The content of clay ranges from 40 to 50 percent. Reaction is moderately alkaline or strongly alkaline. This horizon is noneffervescent to strongly effervescent.

Loafercreek Series

The Loafercreek series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from metavolcanic rocks, mainly greenschist. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 1 to 90 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Loafercreek gravelly loam, on a northwest-facing slope of 18 percent, under a cover of interior live oak, blue oak, foothill pine, whiteleaf manzanita, toyon, buckbrush, Pacific poison oak, honeysuckle, squirreltail, hedgehog dogtail, and rattlesnake brome, at an elevation of 1,197 feet (365 m). When described on 8/4/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); leaves, needles, and duff.

A—0.5 inch to 2 inches (1 to 5 cm); reddish brown (5YR 5/4) gravelly loam, reddish brown (5YR 4/3) moist; 17 percent clay; moderate fine subangular blocky structure parting to moderate fine granular; hard, friable, nonsticky, slightly plastic; common very fine roots; many very fine irregular pores; 20 percent subangular metavolcanic gravel; moderately acid, pH 6.1 by Hellige-Truog; abrupt wavy boundary.

BAt—2 to 6 inches (5 to 15 cm); reddish brown (5YR 5/4) gravelly loam, reddish brown (5YR 4/3) moist; 17 percent clay; moderate medium subangular blocky structure; hard, friable, nonsticky, slightly plastic; few fine and common very fine roots; common very fine tubular pores; 20 percent discontinuous faint clay films on faces of peds; 25 percent subangular metavolcanic gravel; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.

Bt1—6 to 12 inches (15 to 30 cm); yellowish red (5YR 5/6) loam, dark reddish brown (5YR 3/4) moist; 20 percent clay; moderate medium subangular blocky structure;

hard, friable, nonsticky, slightly plastic; common fine and few medium and coarse roots; common very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds and on surfaces along pores; 10 percent subangular metavolcanic gravel; slightly acid, pH 6.2 by Hellige-Truog; clear wavy boundary.

Bt2—12 to 23 inches (30 to 58 cm); yellowish red (5YR 5/6) gravelly loam, yellowish red (5YR 4/6) moist; 24 percent clay; moderate fine subangular blocky structure; hard, friable, slightly sticky, moderately plastic; few fine to coarse roots; many very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds and on surfaces along pores; 5 percent subangular metavolcanic cobbles and 20 percent subangular metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; gradual wavy boundary.

Bt3—23 to 31 inches (58 to 79 cm); yellowish red (5YR 5/6) gravelly silt loam, yellowish red (5YR 4/6) moist; 22 percent clay; moderate fine subangular blocky structure; hard, firm, slightly sticky, moderately plastic; common fine and few medium and coarse roots; common very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds and on surfaces along pores; 20 percent subangular metavolcanic gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt wavy boundary.

Crt—31 to 42 inches (79 to 107 cm); weathered, moderately cemented greenschist; few fine roots; 60 percent continuous prominent clay films on rock fragments; abrupt wavy boundary.

R—42 inches (107 cm); indurated greenschist.

Type location: Butte County, California; about 4.5 miles northeast of Wyandotte, approximately 2,450 feet south and 1,400 feet east of the northwest corner of sec. 8, T. 19 N., R. 5 E.; 39 degrees, 31 minutes, 8.28 seconds north latitude and 121 degrees, 26 minutes, 28.49 seconds west longitude; NAD83; USGS Quad: Oroville Dam, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 24 to 33 percent clay and 5 to 33 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 25 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones. The content of silt is 40 to 50 percent in the surface layer and subsoil.

The A horizon has dry color of 7.5YR 4/6, 5/4, or 5/6 or 5YR 4/4, 4/6, or 5/4. Moist color is 7.5YR 3/4 or 4/4 or 5YR 3/4 or 4/3. Texture is loam or gravelly loam with a high content of silt, or it is silt loam. The content of clay ranges from 14 to 22 percent. The content of gravel is 3 to 20 percent. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 5 to 10 percent. Reaction ranges from strongly acid to neutral.

The BAt horizon has dry color of 7.5YR 4/6 or 5/6 or 5YR 4/6, 5/4, 5/6, or 5/8. Moist color is 7.5YR 3/4 or 4/4; 5YR 4/3, 4/4, or 4/6; or 2.5YR 4/4. Texture is loam or gravelly loam with a high content of silt, or it is silt loam. The content of clay ranges from 15 to 24 percent. The horizon has 3 to 30 percent gravel and 0 to 5 percent cobbles. By sum of cations, base saturation ranges from 65 to 73 percent. The content of organic matter is 1 to 4 percent. Reaction ranges from strongly acid to neutral.

The upper part of the Bt horizon has dry color of 7.5YR 5/6, 5YR 4/6 or 5/6, or 2.5YR 4/6. Moist color is 5YR 3/4, 4/4, or 4/6 or 2.5YR 3/6. Texture is loam, gravelly loam, clay loam, or gravelly clay loam with a high content of silt. The content of clay ranges from 18 to 30 percent. The content of gravel is 5 to 25 percent, and the content of cobbles is 0 to 5 percent. By sum of cations, base saturation ranges from

65 to 73 percent. The content of organic matter is 0.5 to 2.0 percent. Reaction ranges from moderately acid to neutral.

The lower part of the Bt horizon has dry color of 7.5YR 4/6 or 5/6 or 5YR 4/6 or 5/6. Moist color is 7.5YR 4/4 or 4/6; 5YR 4/3, 4/4, or 4/6; or 2.5YR 3/6 or 4/6. Texture is loam, gravelly loam, clay loam, or gravelly clay loam. The content of clay ranges from 18 to 30 percent. The content of gravel is 5 to 30 percent, and the content of cobbles is 0 to 10 percent. By sum of cations, base saturation ranges from 74 to 85 percent. The content of organic matter is 0.5 to 1.5 percent. Reaction ranges from moderately acid to neutral.

Loemstone Series

The Loemstone series consists of deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on terraces along the Feather River. Slopes range from 0 to 2 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Typic Haploxeralfs

Typical Pedon

Loemstone loam, on a slope of less than 1 percent, in a leveled orchard, at an elevation of 87 feet (27 m). When described on 5/9/1995, the soil was moist throughout. Water was seeping at a depth of 48 inches (122 cm). (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 2 inches (0 to 5 cm); brown (10YR 5/3) loam, brown (10YR 4/3) moist; 23 percent clay; strong thin and medium platy structure; hard, firm, slightly sticky, slightly plastic; many very fine and few fine roots; few very fine and fine tubular pores; common fine strong brown (7.5YR 4/6 moist) threadlike oxidized iron masses; noneffervescent; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

Ap2—2 to 4 inches (5 to 10 cm); brown (10YR 5/3) silt loam, brown (10YR 4/3) moist; 23 percent clay; strong medium and thick platy structure; hard, firm, slightly sticky, slightly plastic; many very fine and few fine roots; common very fine and fine tubular pores; common fine gray (10YR 5/1 moist) iron depletions; noneffervescent; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

Ap3—4 to 10 inches (10 to 25 cm); yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; 23 percent clay; moderate medium subangular blocky structure; hard, firm, slightly sticky, slightly plastic; common very fine to medium roots; common very fine and fine tubular pores; common fine gray (10YR 5/1 moist) iron depletions; noneffervescent; slightly acid, pH 6.1 by pH meter 1:1 water; clear smooth boundary.

Bt1—10 to 18 inches (25 to 46 cm); yellowish brown (10YR 5/4) clay loam, brown (7.5YR 4/3) moist; 28 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, slightly plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; few distinct discontinuous clay films on faces of peds and in pores; common fine gray (10YR 5/1 moist) iron depletions; noneffervescent; slightly acid, pH 6.1 by pH meter 1:1 water; gradual smooth boundary.

Bt2—18 to 23 inches (46 to 58 cm); yellowish brown (10YR 5/4) silty clay loam, brown (7.5YR 4/3) moist; 30 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine and fine and few medium tubular

pores; few distinct discontinuous clay films on faces of peds and in pores; noneffervescent; slightly acid, pH 6.3 by meter 1:1 water; gradual smooth boundary.

Bt3—23 to 32 inches (58 to 81 cm); yellowish brown (10YR 5/4) silt loam, brown (7.5YR 4/3) moist; 27 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; few very fine and fine, common medium, and few coarse roots; many very fine and fine and common medium tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; neutral, pH 6.6 by pH meter 1:1 water; gradual smooth boundary.

Bt4—32 to 40 inches (81 to 102 cm); yellowish brown (10YR 5/4) silt loam, brown (10YR 4/3) moist; 26 percent clay; moderate fine and medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine to medium roots; many very fine to medium tubular pores; many distinct continuous clay films on faces of peds and in pores; many fine irregular black (N 2/0) manganese masses; noneffervescent; neutral, pH 6.8 by meter 1:1 water; gradual smooth boundary.

Bt5—40 to 48 inches (102 to 122 cm); light yellowish brown (10YR 6/4) silt loam, brown (10YR 4/3) moist; 24 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine to medium roots; many very fine to medium tubular pores; many distinct continuous clay films on faces of peds and in pores; common fine irregular gray (10YR 6/1 moist) iron depletions; noneffervescent; neutral, pH 6.9 by pH meter 1:1 water; abrupt smooth boundary.

2Cd—48 to 58 inches (122 to 147 cm); pale yellow (2.5Y 7/3) silt, light olive brown (2.5Y 5/3) moist; 7 percent clay; noncemented; massive; hard, very firm, nonsticky, slightly plastic; common very fine and fine tubular pores; common fine strong brown (7.5YR 4/6 moist) oxidized iron masses; noneffervescent; slightly alkaline, pH 7.2 by pH meter 1:1 water.

Type location: Butte County, California; about 2 miles southeast of Gridley, approximately 475 feet east and 220 feet south of the intersection of Evans Reimer Road and Cowee Avenue; in an unsectionized area in the Boga Land Grant; 39 degrees, 20 minutes, 2 seconds north latitude and 121 degrees, 40 minutes, 0 seconds west longitude; NAD27; USGS Quad: Gridley, California.

Range in Characteristics

The depth to densic material is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from May to October (140 to 160 days). The particle-size control section averages 25 to 35 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 3 percent to a depth of 10 inches (25 cm) and 0.2 to 1 percent from 10 to 48 inches (25 to 122 cm). A fluctuating water table can occur between the top of the densic material and 20 inches (51 cm) below the surface of the soil from December through May.

The Ap horizon has dry color of 10YR 5/3, 5/4, or 6/3. Moist color is 10YR 4/3 or 4/2. The content of clay ranges from 18 to 27 percent. Texture is loam or silt loam. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 5/3, 5/4, 5/6, 6/4, or 6/6. Moist color is 10YR 4/2, 4/3, 4/4, 5/3, or 5/4 or 7.5YR 4/3. Texture is loam, silt loam, clay loam, or silty clay loam. The content of clay ranges from 20 to 40 percent and averages 25 to 35 percent. Redoximorphic features, such as iron-manganese masses with moist color of N 2/0 and oxidized iron masses with moist color of 10YR 4/6, 7.5YR 4/4, 4/6, or 5/6, or 5YR 4/6 or 5/6, occur below a depth of 30 inches (76 cm). Reaction ranges from slightly acid to slightly alkaline.

The 2Cd horizon has dry color of 2.5Y 7/4, 7/3, or 6/4 or 10YR 4/4 or 6/4. Moist color is 2.5Y 4/4, 5/3, or 5/4 or 10YR 4/4. Texture is loam, silt loam, silt, very fine sandy loam, or fine sandy loam. The content of clay ranges from 5 to 20 percent. Redoximorphic features, such as iron-manganese masses with moist color of N 2/0 and oxidized iron masses with moist color of 10YR 4/6, 7.5YR 4/4, 4/6, or 5/6, or 5YR 4/6 or 5/6, occur in pores and on the faces of fragments. Rupture resistance ranges from slightly hard to very hard and varies within the horizon at any given point. The horizon is noncemented. The densic material generally has many very fine and fine tubular pores that appear to be remnant root channels. Reaction ranges from slightly acid to moderately alkaline.

Lofgren Series

The Lofgren series consists of deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 19 inches (483 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Very-fine, smectitic, thermic Xeric Epiaquerts

Typical Pedon

Lofgren clay, on a slope of less than 1 percent, under a cover of rice, at an elevation of 83 feet (25 m). When described 5/2/1995, the soil was moist throughout. The water table was at a depth of 43 inches (109 cm). (Colors are for dry soil unless otherwise noted).

Ap—0 to 5 inches (0 to 13 cm); dark gray (10YR 4/1) clay, very dark gray (10YR 3/1) moist; 56 percent clay; weak medium subangular blocky structure parting to strong fine granular; very hard, very firm, very sticky, very plastic; many fine roots; common fine irregular pores; many fine brown (7.5YR 4/4) oxidized iron masses; noneffervescent; strongly acid, pH 5.1 by pH meter 1:1 water; abrupt smooth boundary.

Bssg1—5 to 12 inches (13 to 31 cm); dark gray (10YR 4/1) clay, 50 percent very dark gray (10YR 3/1) and 50 percent dark gray (N 4/0) moist; 65 percent clay; weak medium angular blocky structure; extremely hard, very firm, very sticky, very plastic; few very fine and fine roots; few very fine tubular pores; common slickensides; common fine dark brown (7.5YR 3/3) oxidized iron masses and common fine gray (10YR 5/1) iron depletions; noneffervescent; neutral, pH 6.7 by pH meter 1:1 water; clear smooth boundary.

Bssg2—12 to 29 inches (31 to 74 cm); dark gray (10YR 4/1) clay, dark gray (10YR 4/1) moist; 66 percent clay; moderate coarse prismatic structure; extremely hard, extremely firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; common slickensides; common fine gray (10YR 5/1) iron depletions; noneffervescent; slightly alkaline, pH 7.5 by pH meter 1:1 water; clear smooth boundary.

Bkssg—29 to 38 inches (74 to 97 cm); grayish brown (10YR 5/2) clay, dark gray (10YR 4/1) moist; 65 percent clay; moderate fine angular blocky structure; extremely hard, firm, very sticky, very plastic; common very fine tubular pores; few slickensides; common fine carbonate threads and common fine gray (10YR 5/1) iron depletions; strongly effervescent; moderately alkaline, pH 8.1 by pH meter 1:1 water; abrupt smooth boundary.

Bkg—38 to 44 inches (97 to 112 cm); very pale brown (10YR 8/2) clay, dark gray (10YR 4/1) moist; 61 percent clay; moderate fine prismatic structure parting to weak fine angular blocky; extremely hard, firm, very sticky, very plastic; common very fine tubular pores; common fine carbonate threads and common fine gray

(10YR 5/1) iron depletions; strongly effervescent; moderately alkaline, pH 8.5 by pH meter 1:1 water; abrupt wavy boundary.

2Bkq—44 to 47 inches (112 to 119 cm); light gray (10YR 7/2) clay loam, dark grayish brown (10YR 4/2) moist; 29 percent clay; moderate medium angular blocky structure; very rigid, firm, moderately cemented, moderately sticky, moderately plastic; few very fine and fine tubular pores; common fine carbonate threads; strongly effervescent; strongly alkaline, pH 8.5 by pH meter 1:1 water; abrupt smooth boundary.

2Bkqm1—47 to 62 inches (119 to 158 cm); indurated duripan; light gray (10YR 7/2) sandy loam, brown (7.5YR 4/4) moist; 16 percent clay; massive; very rigid; nonsticky, nonplastic; few very fine and fine tubular pores; common fine carbonate threads; strongly effervescent; strongly alkaline, pH 8.7 by pH meter 1:1 water; alternating layers of cementation with lime and silica filaments; at a depth of 47 inches, indurated capping with lime and silica threads; a very thin layer of sand on top of the capping; abrupt smooth boundary.

2Bkqm2—62 to 82 inches (158 to 208 cm); strongly cemented duripan; pink (7.5YR 7/4) loam, brown (7.5YR 4/4) moist; 17 percent clay; massive; very rigid; nonsticky, slightly plastic; strongly effervescent; moderately alkaline, pH 8.4 by pH meter 1:1 water.

Type location: Butte County, California; about 4.2 miles southwest of Richvale, approximately 200 feet east and 1,000 feet north of the southwest corner of sec. 25, T. 19 N., R. 1 E.; 39 degrees, 28 minutes, 2 seconds north latitude and 121 degrees, 49 minutes, 4 seconds west longitude; NAD27; USGS Quad: West of Biggs, California.

Range in Characteristics

Depth to the duripan is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The soil moisture control section is dry from July to October (120 to 125 days). The particle-size control section averages 60 to 70 percent clay. The soils are calcareous from a depth of 29 to 60 inches (74 to 152 cm). The content of calcium carbonate ranges from trace amounts to 11 percent. By ammonium acetate, base saturation ranges from 80 to 100 percent from a depth of 0 to 12 inches (0 to 31 cm) and is 100 percent from 12 to 82 inches (31 to 208 cm). Electrical conductivity is less than 1 mmho/cm throughout the profile. Reversible, surface-initiated cracks 1 to 2 inches (2.54 to 5 cm) wide extend to a depth of 30 to 35 inches (76 to 89 cm) from May 15 to October 15 (150 days) when the soils are not irrigated. Common slickensides are in the Bssg1, Bssg2, and Bsskg horizons, from 5 to 38 inches (13 to 97 cm). A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through May. Redoximorphic features, such as manganese nodules, oxidized iron masses with color of 7.5YR 4/4 or N 2/0, and a reduced matrix with chroma of 1, occur in the horizons above the duripan. Some pedons do not have a 2Bkq horizon.

The Ap horizon has dry color of 10YR 3/1 or 4/1. Moist color is 10YR 2/1 or 3/1. The content of clay ranges from 60 to 70 percent. The content of organic matter is 1 to 3 percent. Reaction ranges from slightly acid to strongly acid because of applications of fertilizer. The content of exchangeable sodium is 1 to 2 percent.

The Bssg horizon has dry color of 10YR 3/1, 4/1, or 5/1. Moist color is 10YR 3/1 or 4/1 or N 4/0. The content of clay ranges from 60 to 70 percent. The content of organic matter is 0.5 to 1 percent. Reaction ranges from slightly alkaline to moderately alkaline. The content of exchangeable sodium is 1 to 2 percent.

The Bkssg horizon has dry color of 10YR 3/1, 4/1, or 5/2. Moist color is 10YR 3/1, 3/2, 4/1, or 4/2. The content of clay ranges from 60 to 70 percent. The content of organic matter is 0.5 to 1 percent. Reaction ranges from slightly alkaline to moderately alkaline. The content of exchangeable sodium is 2 to 3 percent.

The Bkg horizon has dry color of 10YR 5/1, 5/2, 6/2, 7/2, or 8/2. Moist color is 10YR 4/1 or 4/2. Texture is clay or silty clay. The content of clay ranges from 50 to 60 percent. The content of organic matter is 0.1 to 1 percent. Reaction is moderately alkaline or strongly alkaline. The content of exchangeable sodium is 2 to 3 percent.

2Bkq horizon has dry color of 10YR 5/2, 6/2, 7/2, or 8/2. Moist color is 10YR 4/2 or 5/2. Texture is clay loam or silty clay loam. The content of clay ranges from 27 to 40 percent. The content of organic matter is 0.1 to 1 percent. Reaction is moderately alkaline or strongly alkaline. The content of exchangeable sodium is 2 to 3 percent.

The 2Bkqm horizon has dry color of 10YR 5/2, 6/2, 7/2, or 7/3 or 7.5YR 7/4. Moist color is 10YR 4/2, 4/3, or 5/2 or 7.5YR 4/4. Rupture resistance ranges from indurated to strongly cemented. The horizon has alternating layers that are moderately cemented and weakly cemented with silica and calcium carbonate. The content of calcium carbonate ranges from 2 to 11 percent. The content of exchangeable sodium is 3 to 4 percent.

Logtrain Series

The Logtrain series consists of deep, well drained soils that formed in colluvium and residuum derived from metavolcanic and metasedimentary rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 110 percent. The mean annual precipitation is about 72 inches (1,829 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, mesic Typic Haploxerults

Typical Pedon

Logtrain gravelly loam, on a southwest-facing slope of 80 percent, under a cover of incense cedar, Douglas-fir, ponderosa pine, canyon live oak, tanoak, and bigleaf maple, at an elevation of 2,720 feet (829 m). When described on 7/27/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 3 inches (3 to 8 cm); pale yellow (2.5Y 7/3) gravelly loam, light olive brown (2.5Y 5/3) moist; 20 percent clay; weak fine and medium subangular blocky structure parting to moderate fine and medium granular; moderately hard, very friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine to medium irregular and tubular pores; 30 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt1—3 to 9 inches (8 to 23 cm); pale yellow (2.5Y 7/3) very gravelly loam, light olive brown (2.5Y 5/3) moist; 22 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; common very fine to coarse roots; many very fine to medium tubular pores; 60 percent continuous faint clay films; 10 percent cobbles and 25 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; gradual smooth boundary.

Bt2—9 to 21 inches (23 to 53 cm); pale yellow (2.5Y 7/4) very gravelly loam, light olive brown (2.5Y 5/4) moist; 25 percent clay; moderate fine and medium subangular blocky structure; very hard, very friable, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; many very fine to medium tubular pores; 80 percent continuous faint clay films; 5 percent cobbles and 30 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

Bt3—21 to 38 inches (53 to 97 cm); very pale brown (10YR 7/4) very cobbly loam, yellowish brown (10YR 5/4) moist; 26 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; many very fine to medium and few coarse roots; many very fine to

medium tubular pores; 80 percent continuous faint clay films; 15 percent gravel and 25 percent cobbles; very strongly acid, pH 5.0 by Hellige-Truog; gradual smooth boundary.

Bt4—38 to 54 inches (97 to 137 cm); very pale brown (10YR 7/3) extremely gravelly loam, light yellowish brown (10YR 6/4) moist; 23 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium tubular pores; 60 percent continuous faint clay films; 20 percent stones, 20 percent cobbles, and 30 percent gravel; very strongly acid, pH 5.0 by Hellige-Truog; gradual smooth boundary.

R—54 inches (137 cm); strongly cemented metavolcanic bedrock; very strongly acid, pH 5.0 by Hellige-Truog.

Type location: Butte County, California; about 0.87 mile northeast of Robley Point, approximately 125 feet south and 1,950 feet west of the northeast corner of sec. 10, T. 23 N., R. 4 E.; 39 degrees, 52 minutes, 21 seconds north latitude and 121 degrees, 30 minutes, 27 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 47 to 57 degrees F (8 to 14 degrees C). The particle-size control section averages 15 to 27 percent clay and 35 to 85 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 50 percent gravel, 0 to 30 percent cobbles, 0 to 20 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 7.5YR 6/3 or 6/4; 10YR 6/2, 6/3, 6/4, or 7/4; or 2.5Y 6/3 or 7/3. Moist color is 7.5YR 3/2, 4/2, or 4/3; 10YR 3/2, 4/2, or 4/3; or 2.5Y 4/3 or 5/3. Texture is gravelly loam, very gravelly loam, gravelly sandy loam, very gravelly sandy loam, or extremely gravelly sandy loam. The content of clay ranges from 10 to 22 percent. The horizon has 25 to 65 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. Reaction ranges from slightly acid to very strongly acid.

The Bt horizon has dry color of 7.5YR 6/3, 6/4, 6/6, 7/3, or 7/4; 10YR 5/4, 6/4, 6/6, 7/3, 7/4, 8/2, or 8/3; or 2.5Y 7/3 or 7/4. Moist color is 7.5YR 3/3, 4/2, 4/3, 4/4, 4/6, or 5/4; 10YR 4/4, 4/6, 5/3, 5/4, 6/4, or 6/6; or 2.5Y 5/3, 5/4, or 6/4. Texture is very gravelly loam, extremely gravelly loam, very cobbly loam, gravelly sandy loam, very gravelly sandy loam, extremely gravelly sandy loam, very cobbly sandy loam, extremely cobbly sandy loam, very stony sandy loam, or gravelly sandy clay loam. The content of clay ranges from 12 to 27 percent. The horizon has 15 to 80 percent gravel, 0 to 40 percent cobbles, and 0 to 40 percent stones. Reaction ranges from slightly acid to extremely acid.

Lomarica Series

The Lomarica series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from metavolcanic rocks, mainly greenschist. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 4 to 30 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Clayey-skeletal, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Lomarica loam, on a east-facing slope of 25 percent, under a cover of annual grasses, forbs, and a trace of blue oak, at an elevation of 350 feet (107 m). When

described on 7/13/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); brown (7.5YR 5/3) loam, dark brown (7.5YR 3/3) moist; 15 percent clay; moderate very fine and fine subangular blocky structure; slightly hard, very friable, nonsticky, slightly plastic; many very fine roots; common fine and few very fine tubular pores; 3 percent subangular metavolcanic gravel; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

BAt—1 to 5 inches (3 to 13 cm); brown (7.5YR 5/4) loam, dark brown (7.5YR 3/4) moist; 20 percent clay; strong fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and many very fine roots; many very fine tubular pores; 10 percent discontinuous faint clay films; 3 percent subangular metavolcanic gravel; slightly acid, pH 6.6 by Hellige-Truog; clear wavy boundary.

Bt1—5 to 9 inches (13 to 23 cm); brown (7.5YR 5/4) clay loam, brown (7.5YR 4/4) moist; 29 percent clay; strong fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; common fine, few medium, and many very fine roots; common fine and many very fine tubular pores; 15 percent discontinuous faint clay films; 5 percent subangular metavolcanic gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bt2—9 to 12 inches (23 to 30 cm); brown (7.5YR 5/4) clay loam, brown (7.5YR 4/4) moist; 32 percent clay; moderate very fine and fine subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common fine and many very fine roots; few medium and many very fine tubular pores; 20 percent discontinuous distinct clay films; 10 percent subangular metavolcanic gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual irregular boundary.

2Bt3—12 to 25 inches (30 to 64 cm); strong brown (7.5YR 5/6) extremely gravelly clay loam, strong brown (7.5YR 4/6) moist; 39 percent clay; moderate very fine and fine subangular blocky structure; hard, friable, moderately sticky, moderately plastic; few coarse and many very fine roots; few medium and common very fine tubular pores; 35 percent discontinuous distinct clay films; 65 percent subangular metavolcanic gravel; slightly acid, pH 6.6 by Hellige-Truog; clear wavy boundary.

2Btss—25 to 32 inches (64 to 81 cm); yellowish brown (10YR 5/4) extremely gravelly clay, dark yellowish brown (10YR 4/4) moist; 52 percent clay; strong medium and coarse subangular blocky structure; very hard, very firm, very sticky, very plastic; common fine, few coarse, and many very fine roots; common very fine tubular pores; 15 percent slickensides; 45 percent continuous distinct clay films; 80 percent subangular metavolcanic gravel; neutral, pH 6.7 by Hellige-Truog; clear wavy boundary.

2Cr—32 inches (81 cm); greenschist; few very fine roots in cracks; many very fine and few fine tubular pores.

Type location: Butte County, California; about 6.5 miles northwest of Loma Rica, approximately 450 feet north and 2,400 feet east of the southwest corner of sec. 8, T. 17 N., R. 5 E.; 39 degrees, 20 minutes, 20.10 seconds north latitude and 121 degrees, 26 minutes, 11.70 seconds west longitude; NAD83; USGS Quad: Loma Rica, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 35 to 45 percent clay and 40 to 65 percent rock fragments, mostly gravel. Mineralogy is mixed. Slickensides range from 45 to 55

percent in the 2Btss horizon. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 2 percent cobbles. Some pedons have a BCt horizon.

The A horizon has dry color of 7.5YR 4/4, 4/6, or 5/3 or 5YR 4/4. Moist color is 7.5YR 3/3 or 3/4 or 5YR 3/4. Texture is loam. The content of clay ranges from 15 to 20 percent. The horizon has 3 to 10 percent gravel and 0 to 5 percent cobbles. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 5 to 10 percent. Reaction ranges from moderately acid to neutral.

The BAt horizon has dry color of 7.5YR 5/4 or 5YR 4/6 or 5/6. Moist color is 7.5YR 3/4 or 5YR 4/4 or 4/6. Texture is loam or gravelly loam. The content of clay ranges from 18 to 23 percent. The horizon has 3 to 20 percent gravel and 0 to 5 percent cobbles. By sum of cations, base saturation ranges from 65 to 74 percent. The content of organic matter is 1 to 4 percent. Reaction is slightly acid or neutral.

The Bt1 horizon has dry color of 7.5YR 5/4 or 5YR 4/6 or 5/6. Moist color is 7.5YR 4/4 or 5YR 3/4 or 4/4. Texture is clay loam, gravelly clay loam, very gravelly clay loam, or extremely gravelly clay loam. The content of clay ranges from 29 to 38 percent. The horizon has 5 to 60 percent gravel and 0 to 15 percent cobbles. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 0.5 to 2 percent. Reaction is slightly acid.

The Bt2 horizon has dry color of 7.5YR 5/4 or 5YR 4/6 or 5/6. Moist color is 7.5YR 4/4 or 5YR 3/4, 4/4, or 4/6. Texture is clay loam, gravelly clay loam, very gravelly clay, or extremely gravelly clay. The content of clay ranges from 32 to 44 percent. The horizon has 10 to 65 percent gravel and 0 to 15 percent cobbles. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 0.5 to 2 percent. Reaction is moderately acid or slightly acid.

The 2Bt3 horizon has dry color of 7.5YR 5/6 or 5YR 4/6. Moist color is 7.5YR 4/6 or 5YR 3/4. Texture is extremely gravelly clay loam or extremely gravelly clay. The content of clay ranges from 35 to 45 percent. The horizon has 60 to 65 percent gravel and 0 to 15 percent cobbles. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 0.5 to 2 percent. Reaction is slightly acid or neutral.

The 2Btss horizon has dry color of 5YR 4/6 or 10YR 6/4. Moist color is 5YR 4/4 or 10YR 5/4. Texture is clay or extremely gravelly clay. The content of clay ranges from 45 to 55 percent. The horizon has 5 to 80 percent gravel and 0 to 15 percent cobbles. By sum of cations, base saturation ranges from 75 to 85 percent. The content of organic matter is 0.5 to 1 percent. Reaction is neutral.

Lucksev Series

The Lucksev series consists of shallow or very shallow, moderately well drained soils that formed in residuum, colluvium, and alluvium derived from volcanic rocks. These soils are on ridgetops, side slopes, and strath terraces on Cascade foothills. Slopes range from 2 to 35 percent. The mean annual precipitation is about 27 inches (686 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Clayey, mixed, superactive, thermic, shallow Typic Haploxeralfs

Typical Pedon

Lucksev loam, on a west-facing slope of 35 percent, under a cover of annual grasses and forbs, at an elevation of 300 feet (91 m). When described on 5/10/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light yellowish brown (10YR 6/4) loam, brown (10YR 4/3) moist; 25 percent clay; moderate thin and medium platy structure parting to moderate fine and medium subangular blocky; very hard, friable, slightly sticky,

slightly plastic; common fine and many very fine roots; common very fine and fine and few medium irregular and tubular pores; 5 percent andesite gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 7 inches (5 to 18 cm); brown (7.5YR 5/3) clay loam, brown (7.5YR 4/3) moist; 34 percent clay; strong medium and coarse angular blocky structure; extremely hard, firm, moderately sticky, moderately plastic; common very fine roots; common very fine and fine irregular and tubular pores; 70 percent continuous faint clay films; 2 percent quartz gravel and 10 percent andesite gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bt2—7 to 15 inches (18 to 38 cm); light brown (7.5YR 6/4) clay, brown (7.5YR 4/3) moist; 40 percent clay; strong fine and medium subangular blocky structure; extremely hard, firm, very sticky, very plastic; common very fine roots; many very fine and fine and common medium tubular pores; 90 percent continuous distinct clay films; 5 percent andesite gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

2Crq—15 inches (38 cm); moderately cemented volcanic sandstone bedrock with a silica cap, 1 mm thick, on top.

Type location: Butte County, California; about 1.25 miles south of Durham-Pentz Road and about 0.5 mile west of Clark Road, approximately 100 feet south and 2,000 feet east of the northwest corner of sec. 4, T. 20 N., R. 3 E.; 39 degrees, 37 minutes, 30 seconds north latitude and 121 degrees, 38 minutes, 42 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

The depth to paralithic bedrock is 4 to 20 inches (10 to 51 cm). The mean annual soil temperature is 60 to 68 degrees F (16 to 20 degrees C). The particle-size control section averages 35 to 45 percent clay and 2 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. On the gentler slopes, a fluctuating water table can occur between the top of the bedrock and a depth of 2 inches (5 cm) from December through March. Redoximorphic features, such as oxidized iron masses and iron-manganese concretions, occur in the A horizon, and manganese accumulations occur on top of the paralithic contact. Rock fragments on the surface range from 0 to 15 percent gravel, 0 to 20 percent cobbles, 0 to 5 percent stones, and 0 to 2 percent boulders.

The A horizon has dry color of 10YR 6/2, 6/3, or 6/4 or 7.5YR 5/3, 6/3, or 7/3. Moist color is 10YR 4/2 or 4/3 or 7.5YR 4/2 or 4/3. Texture is loam, gravelly loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 22 to 35 percent. The horizon has 2 to 35 percent gravel and 0 to 15 percent cobbles. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 5/3, 6/3, 6/4, or 7/4 or 10YR 6/3 or 7/3. Moist color is 7.5YR 4/2, 4/3, or 4/4 or 10YR 4/3 or 5/3. Texture is clay loam, sandy clay loam, sandy clay, clay, gravelly clay loam, gravelly clay, gravelly sandy clay, or cobbly clay. The content of clay ranges from 30 to 50 percent. The horizon has 2 to 30 percent gravel and 0 to 15 percent cobbles. Reaction is neutral or slightly alkaline.

Lumpkin Series

The Lumpkin series consists of shallow, well drained soils that formed in mixed tephra and residuum and colluvium derived from basalt. These soils are on the tops and side slopes of basalt ridges on volcanic Sierra Nevada mountains. Slopes range from 0 to 70 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Medial-skeletal, amorphic, mesic Lithic Haploxerands

Typical Pedon

Lumpkin gravelly medial sandy loam, on a southwest-facing slope of 2 percent, under a cover of greenleaf manzanita, at an elevation of 4,235 feet (1,318 m). When described on 6/19/1995, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); dark brown (10YR 3/3) gravelly medial sandy loam, very dark grayish brown (10YR 3/2) moist; 12 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common very fine and fine roots; many very fine irregular pores; 20 percent subangular basalt gravel; strongly acid, pH 5.3 by Hellige-Truog; NaF pH 10.6; abrupt smooth boundary.

Bw1—3 to 8 inches (8 to 20 cm); brown (10YR 4/3) extremely gravelly medial fine sandy loam, very dark grayish brown (10YR 3/2) moist; 15 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common very fine and fine and few medium roots; many very fine irregular pores; 25 percent subangular basalt cobbles and 40 percent subangular basalt gravel; strongly acid, pH 5.3 by Hellige-Truog; NaF pH 10.9; clear smooth boundary.

Bw2—8 to 14 inches (20 to 36 cm); brown (10YR 4/3) extremely cobbly medial sandy loam, very dark grayish brown (10YR 3/2) moist; 14 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common very fine and fine roots; many very fine irregular pores; 5 percent subangular basalt gravel and 80 percent subangular basalt cobbles; strongly acid, pH 5.3 by Hellige-Truog; NaF pH 10.6; abrupt smooth boundary.

R—14 inches (36 cm); fractured, indurated basalt bedrock.

Type location: Butte County, California; about 1.25 miles east of Camp Eighteen, approximately 1,950 feet east and 400 feet north of the southwest corner of sec. 36, T. 21 N., R. 7 E.; 39 degrees, 37 minutes, 47 seconds north latitude and 121 degrees, 8 minutes, 52 seconds west longitude; NAD27; USGS Quad: Cascade, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The particle-size control section averages 12 to 18 percent clay and 35 to 65 percent rock fragments, mostly gravel and cobbles. Mineralogy is amorphic. The content of organic matter is 5 to 15 percent to a depth of 14 inches (36 cm). By ammonium acetate, base saturation ranges from 9 to 23 percent to a depth of 14 inches (36 cm). NaF pH is 10.5 to 12.0 throughout the profile. Rock fragments on the surface range from 10 to 80 percent gravel, 5 to 20 percent cobbles, and 0 to 5 percent stones.

The A horizon has dry color of 10YR 3/2, 3/3, 4/3, or 5/3. Moist color is 10YR 2/1 or 3/2 or 7.5YR 3/2. Texture is gravelly medial sandy loam, very gravelly medial fine sandy loam, or extremely gravelly medial fine sandy loam. The content of clay ranges from 8 to 12 percent. The content of gravel is 20 to 65 percent. Reaction ranges from slightly acid to strongly acid.

The Bw horizon has dry color of 10YR 4/3 or 5/3 or 7.5YR 3/2. Moist color is 10YR 3/1 or 3/2, 7.5YR 3/2, or 5YR 2/1. Texture is extremely gravelly medial fine sandy loam, extremely cobbly medial fine sandy loam, extremely cobbly medial sandy loam, or very gravelly medial sandy loam. The content of clay ranges from 9 to 18 percent. The horizon has 5 to 60 percent gravel and 5 to 80 percent cobbles. Reaction ranges from slightly acid to strongly acid.

Lumpkin Taxadjunct

The Lumpkin taxadjunct consists of very shallow, well drained soils that formed in mixed tephra and residuum and colluvium derived from volcanic rocks. These soils are on the tops and side slopes of volcanic nunataks and ridges on Southern Cascade and volcanic Sierra Nevada mountains. Slopes range from 0 to 30 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Medial-skeletal, amorphic, frigid Lithic Haploxerands

Typical Pedon

Lumpkin taxadjunct, on a southeast-facing slope of 2 percent, under a cover of shrubs, at an elevation of 5,680 feet (1,731 m). When described on 10/2/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 4 inches (0 to 10 cm); grayish brown (10YR 5/2) very gravelly medial very fine sandy loam, dark brown (7.5YR 3/2) moist; 13 percent clay; moderate medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; few very fine roots; many very fine irregular pores; 55 percent subangular basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 11.5; abrupt smooth boundary.

Bw—4 to 9 inches (10 to 23 cm); yellowish brown (10YR 5/4) very gravelly medial very fine sandy loam, brown (7.5YR 4/3) moist; 15 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few medium and common very fine roots; many very fine irregular pores; 50 percent subangular basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 10.5; abrupt smooth boundary.

R—9 inches (23 cm); indurated basalt bedrock.

Type location: Plumas County, California; about 2.3 miles southwest of Dogwood Peak, approximately 1,200 feet west and 200 feet north of the southeast corner of sec. 16, T. 22 N., R. 8 E.; 39 degrees, 45 minutes, 37 seconds north latitude and 121 degrees, 5 minutes, 11 seconds west longitude; NAD83; USGS Quad: Dogwood Peak, California.

Range in Characteristics

The depth to lithic bedrock is 5 to 10 inches (13 to 51 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The particle-size control section averages 14 to 18 percent clay and 40 to 55 percent rock fragments, mostly basalt gravel. Mineralogy is amorphic. The content of organic matter is 5 to 12 percent to a depth of 9 inches (23 cm). By ammonium acetate, base saturation ranges from 10 to 35 percent to a depth of 9 inches (23 cm). NaF pH is 10 to 11.5 throughout the profile. Acid-oxalate extractable Al plus ½ Fe ranges from 2.9 to 3.5 percent (by weight) to a depth of 9 inches (23 cm). Rock fragments on the surface range from 50 to 70 percent gravel, 15 to 30 percent cobbles, and 0 to 20 percent boulders.

The A horizon has dry color of 10YR 5/2 or 5/3. Moist color is 7.5YR 3/2 or 3/3. Texture is very gravelly medial very fine sandy loam. The content of clay ranges from 10 to 15 percent. The horizon has 35 to 60 percent gravel and 0 to 10 percent cobbles. Reaction ranges from very strongly acid to slightly acid.

The Bw horizon has dry color of 10YR 5/4 or 6/4. Moist color is 7.5YR 4/3 or 4/4. Texture is very gravelly medial very fine sandy loam. The content of clay ranges from 14 to 18 percent. The horizon has 45 to 60 percent gravel and 0 to 10 percent cobbles. Reaction is moderately acid or slightly acid.

The Lumpkin taxadjunct is a taxadjunct because it has a frigid soil temperature regime and is very shallow. These differences do not significantly affect the use, management, or interpretations of the soils.

Lydon Series

The Lydon series consists of moderately deep, somewhat excessively drained soils that formed in weathered tephra over residuum and colluvium derived from volcanic rocks, dominantly mudflow breccia. These soils are on the tops and side slopes of volcanic ridges in the Cascade Mountains. Slopes range from 2 to 100 percent. The mean annual precipitation is about 62 inches (1,575 mm), and the mean annual air temperature is about 54 degrees F (12 degrees C).

Taxonomic class: Loamy-skeletal, isotic, mesic Andic Dystroxerepts

Typical Pedon

Lydon very gravelly medial coarse sandy loam on an east-facing slope of 5 percent, under a cover of California black oak and scattered mixed conifers, at an elevation of 3,630 feet (1,106 m). When described on 11/27/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); oak and pine litter.

Oe—0.5 to 1 inch (1 to 2 cm); partially decomposed oak and pine litter.

A—1 to 3 inches (2 to 7 cm); dark grayish brown (10YR 4/2) very gravelly medial coarse sandy loam, dark brown (7.5YR 3/2) moist; 11 percent clay; moderate fine subangular blocky structure parting to moderate fine granular; soft, very friable, nonsticky, slightly plastic; common very fine and fine roots; many very fine and fine and common medium and coarse irregular pores; noneffervescent; 2 percent cobbles and 40 percent gravel; moderately acid, pH 5.7 by pH meter 1:1 water; NaF pH 10.7; clear smooth boundary.

Bw1—3 to 6 inches (7 to 15 cm); brown (10YR 5/3) very gravelly medial coarse sandy loam, dark brown (7.5YR 3/3) moist; 10 percent clay; weak medium subangular blocky structure; soft, very friable, nonsticky, slightly plastic; common very fine and fine and few medium roots; many very fine and fine irregular pores, common very fine and fine tubular pores, and common medium irregular pores; noneffervescent; 10 percent cobbles and 35 percent gravel; moderately acid, pH 5.8 by pH meter 1:1 water; NaF pH 10.8; clear smooth boundary.

Bw2—6 to 13 inches (15 to 33 cm); brown (7.5YR 5/3) extremely gravelly sandy loam, dark brown (7.5YR 3/4) moist; 11 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; many very fine to coarse roots; many very fine and fine and common medium irregular and tubular pores; noneffervescent; 15 percent cobbles and 50 percent gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bw3—13 to 21 inches (33 to 53 cm); light brown (7.5YR 6/4) extremely gravelly sandy loam, brown (7.5YR 4/4) moist; 15 percent clay; moderate fine granular structure; loose, nonsticky, slightly plastic; many very fine to medium and few coarse roots; many very fine and fine and common medium irregular and tubular pores; noneffervescent; 25 percent cobbles and 65 percent gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.2; clear smooth boundary.

Bw4—21 to 35 inches (53 to 88 cm); light yellowish brown (10YR 6/4) extremely cobbly fine sandy loam, dark yellowish brown (10YR 4/4) moist; 16 percent clay; moderate fine granular structure; loose, nonsticky, slightly plastic; common very fine to medium roots; many very fine and fine and common medium irregular and tubular pores; noneffervescent; 70 percent cobbles and 20 percent gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.3; clear smooth boundary.

R—35 inches (88 cm); fractured, indurated andesite; fractures occurring 8 to 20 inches (20 to 51 cm) apart.

Type location: Butte County, California; about 0.6 mile southeast of Ewalt Camp, approximately 2,100 feet east and 350 feet north of the northwest corner of sec. 2, T. 24 N., R. 3 E.; in an unsectionized area; 39 degrees, 58 minutes, 30.3 seconds north latitude and 121 degrees, 36 minutes, 30.4 seconds west longitude; NAD27; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 52 to 59 degrees F (11 to 15 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 12 to 20 percent clay and 35 to 80 percent rock fragments, mostly gravel. Mineralogy is isotic. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.94 in the A horizon to 1.34 in the Bw4 horizon. Rock fragments on the surface range from 20 to 50 percent gravel, 0 to 20 percent cobbles, and 0 to 15 percent stones.

The A horizon has dry color of 5YR 6/4, 7.5YR 5/3 or 6/3, or 10YR 4/2. Moist color is 5YR 3/2, 3/3, or 4/3 or 7.5YR 3/2, 3/4, or 4/3. Texture is very gravelly medial coarse sandy loam, very gravelly medial sandy loam, or gravelly medial sandy loam. The content of clay ranges from 10 to 18 percent. The horizon has 20 to 40 percent gravel, 0 to 20 percent cobbles, and 0 to 15 percent stones. The content of organic matter is 10 to 18 percent. By ammonium acetate, base saturation ranges from 30 to 40 percent. NaF pH is 10 to 11. Reaction ranges from moderately acid to neutral.

The upper part of the Bw horizon has dry color of 7.5YR 4/4, 5/3, 5/4, 6/4, or 6/6 or 10YR 5/3 or 6/3. Moist color is 7.5YR 3/3, 3/4, 4/3, or 4/4 or 5YR 4/3 or 4/4. Texture is very gravelly medial coarse sandy loam, gravelly medial sandy loam, very gravelly medial sandy loam, or extremely gravelly medial sandy loam. The content of clay ranges from 10 to 18 percent. The content of gravel is 10 to 50 percent, the content of cobbles is 5 to 20 percent, and the content of stones is 0 to 15 percent. The content of organic matter is 3 to 13 percent. By ammonium acetate, base saturation ranges from 25 to 35 percent. NaF pH is 9.8 to 11. Reaction ranges from strongly acid to neutral.

The lower part of the Bw horizon has dry color of 7.5YR 6/3 or 6/4 or 10YR 6/3 or 6/4. Moist color is 5YR 4/4; 7.5YR 3/4, 4/3, or 4/4; or 10YR 4/3. Texture is very gravelly sandy loam, extremely gravelly sandy loam, or extremely cobbly fine sandy loam. The content of clay ranges from 12 to 20 percent. The content of gravel is 20 to 65 percent, the content of cobbles is 15 to 70 percent, and the content of stones is 0 to 15 percent. The content of organic matter is 1 to 5 percent. By ammonium acetate, base saturation ranges from 35 to 45 percent. NaF pH is 9.5 to 10.5. Reaction ranges from strongly acid to slightly acid.

Mac Series

The Mac series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from metasedimentary and metavolcanic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Typic Haploxerults

Typical Pedon

Mac gravelly loam, on a south-southwest-facing slope of 15 percent, under a cover of ponderosa pine, white fir, sugar pine, Douglas-fir, incense cedar, and tanoak, at an elevation of 3,540 feet (1,079 m). When described on 7/15/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 4 inches (3 to 10 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/4) moist; 23 percent clay; moderate fine and medium granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine and fine and few medium roots; many very fine to medium irregular and tubular pores; 15 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt1—4 to 9 inches (10 to 22 cm); reddish yellow (5YR 7/6) very gravelly loam, yellowish red (5YR 5/6) moist; 27 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and medium, few coarse, and many very fine roots; many very fine to coarse irregular and tubular pores; 80 percent continuous faint clay films; 15 percent cobbles and 25 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt2—9 to 15 inches (22 to 38 cm); reddish yellow (5YR 6/6) gravelly silty clay loam, yellowish red (5YR 5/6) moist; 29 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine to coarse tubular pores; 80 percent continuous distinct clay films; 25 percent gravel; strongly acid, pH 5.4 by Hellige-Truog; gradual smooth boundary.

Bt3—15 to 23 inches (38 to 58 cm); reddish yellow (5YR 6/6) silty clay loam, yellowish red (5YR 5/6) moist; 31 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, moderately plastic; common very fine to coarse roots; many very fine and fine and common medium tubular pores; 80 percent continuous distinct clay films; 10 percent gravel; strongly acid, pH 5.3 by Hellige-Truog; clear smooth boundary.

Crt—23 to 37 inches (58 to 94 cm); pale brown (10YR 6/3) very gravelly silt loam, brown (10YR 5/3) moist; 27 percent clay; massive; soft, very friable, slightly sticky, slightly plastic; few very fine and fine and common medium roots; few very fine to medium tubular pores; 20 percent continuous distinct clay films; 60 percent gravel; very strongly acid, pH 5.0 by Hellige-Truog; clear smooth boundary.

Cr—37 inches (94 cm); weakly cemented phyllite bedrock.

Type location: Butte County, California; about 2.9 miles northeast of Sawmill Peak, approximately 2,000 feet north and 2,000 feet west of the southeast corner of sec. 22, T. 23 N., R. 4 E.; 39 degrees, 50 minutes, 8 seconds north latitude and 121 degrees, 30 minutes, 45 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 50 to 57 degrees F (10 to 14 degrees C). The particle-size control section averages 18 to 35 percent clay and 15 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 5 to 50 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones.

The A horizon has dry color of 7.5YR 5/4, 6/4, or 6/6 or 10YR 6/2, 6/3, 6/4, 7/2, 7/3, or 7/4. Moist color is 7.5YR 4/4, 5YR 4/4 or 4/6, or 10YR 3/2, 4/2, 4/3, 4/4, or 5/4. Texture is gravelly loam, very gravelly loam, or very gravelly sandy loam. The content

of clay ranges from 15 to 25 percent. The horizon has 15 to 45 percent gravel and 0 to 10 percent cobbles. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 5YR 5/6, 6/6, or 7/6; 7.5YR 5/6, 6/6, 7/6, or 7/3; or 10YR 6/4, 7/4, 7/2, 7/3, or 8/6. Moist color is 5YR 4/4, 4/6, 5/6, or 5/8; 7.5YR 4/3, 4/4, 5/4, 5/6, or 6/6; 10YR 4/2, 4/3, 5/3, or 6/6; or 2.5YR 4/6. Texture is gravelly loam, very gravelly loam, clay loam, gravelly clay loam, silt loam, silty clay loam, gravelly silty clay loam, or gravelly sandy loam. The content of clay ranges from 17 to 35 percent. The horizon has 10 to 45 percent gravel and 0 to 15 percent cobbles. Reaction ranges from strongly acid to slightly acid.

The Crt horizon has dry color of 10YR 6/3, 6/4, or 7/3 or 2.5Y 6/2. Moist color is 10YR 5/3 or 2.5Y 4/2. Texture is very gravelly silt loam, extremely gravelly loam, extremely gravelly sandy clay loam, or extremely cobbly loam. The content of clay ranges from 16 to 27 percent. The horizon has 30 to 80 percent gravel and 0 to 40 percent cobbles. Reaction ranges from very strongly acid to slightly acid.

Marcum Series

The Marcum series consists of deep or very deep, moderately well drained soils that formed in alluvium derived from mixed sources. These soils are on low terraces and basin rims. Slopes range from 0 to 2 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Typic Argixerolls

Typical Pedon

Marcum clay loam, on a slope of 1 percent, in an irrigated pear orchard, at an elevation of 37 feet (11 m). When described on 8/16/1978, the soil was dry to a depth of 6 inches (15 cm) and moist below that depth. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 6 inches (0 to 15 cm); brown (10YR 5/3) clay loam, dark brown (10YR 3/3) moist; moderate fine and medium subangular blocky structure; hard, friable, sticky, plastic; few fine tubular and irregular pores; neutral, pH 7.0; clear smooth boundary.

A—6 to 16 inches (15 to 41 cm); brown (10YR 4/3) clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; hard, friable, sticky, plastic; common very fine and few fine roots; common very fine tubular pores; slightly alkaline, pH 7.5; gradual wavy boundary.

Bt1—16 to 28 inches (41 to 71 cm); dark yellowish brown (10YR 4/4) clay loam, dark yellowish brown (10YR 3/4) moist; weak medium and coarse subangular blocky structure; very hard, firm, very sticky, very plastic; few very fine and fine roots; few very fine tubular pores; few thin clay films and pressure faces on peds; few fine manganese concretions; moderately alkaline, pH 8.0; clear wavy boundary.

Bt2—28 to 40 inches (71 to 102 cm); strong brown (7.5YR 5/6) clay, strong brown (7.5YR 4/6) moist; weak fine and medium prismatic structure; very hard, firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; many thin clay films and pressure faces on peds; few very fine and fine manganese concretions; moderately alkaline, pH 8.0; gradual wavy boundary.

Bk—40 to 43 inches (102 to 109 cm); light yellowish brown (10YR 6/4) clay loam, dark yellowish brown (10YR 4/4) moist; massive; hard, friable, sticky, plastic; few very fine roots; few very fine tubular pores; few thin clay films on faces of peds; few very fine manganese concretions; slightly effervescent; disseminated lime; moderately alkaline, pH 8.0; abrupt wavy boundary.

2Cr—43 to 62 inches (109 to 158 cm); very pale brown (10YR 7/4) siltstone, light yellowish brown (10YR 6/4) moist; many black (10YR 2/1) manganese stains on

fracture faces; many yellowish brown (10YR 5/8), brownish yellow (10YR 6/6 and 6/8), and strong brown (7.5YR 5/8) mottles on fracture faces and in pores; massive; very hard, very firm; many very fine and few fine and coarse tubular pores; slightly effervescent; lime in seams and in a laminar cap, 0.5 cm thick, that is discontinuous within the pedon; moderately alkaline, pH 8.0.

Type location: Sutter County, California; about 0.6 mile northwest of Tudor on Highway 99, then 150 feet west into a pear orchard, approximately 365 feet south and 120 feet west of the northeast corner of sec. 4, T. 13 N., R. 3 E.; 39 degrees, 37 minutes, 8 seconds north latitude and 121 degrees, 38 minutes, 3 seconds west longitude; NAD27; USGS Quad: Gilsizer Slough, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 80 inches (102 to 203 cm). The mean annual soil temperature is 60 to 65 degrees F (16 to 18 degrees C). The soil temperature is above 47 degrees F (8 degrees C) the entire year. The difference between the mean summer and mean winter soil temperature is 30 to 33 degrees F. In nonirrigated areas, the soil between depths of 6 and 17 inches (15 to 43 cm) is dry in all parts from June to October and is moist in some or all parts from November to May. Reaction is neutral to moderately alkaline.

The A horizon has dry color of 10YR 5/2, 5/3, or 4/3 or 7.5YR 5/2. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2. The content of clay ranges from 27 to 35 percent.

The Bt horizon has dry color of 10YR 4/4, 5/3, 5/4, 6/3, 6/4, or 7/4 or 7.5YR 6/4 or 5/6. Moist color is 10YR 3/4, 4/3, 4/4, or 5/4 or 7.5YR 3/2, 3/3, 4/4, or 4/6. Texture is clay loam, silty clay loam, clay, or silty clay. The content of clay ranges from 30 to 60 percent.

The Bk horizon has dry color of 10YR 5/4 or 6/4. Moist color is 10YR 4/3, 4/4, or 5/4. The content of clay ranges from 30 to 40 percent.

Mariposa Taxadjunct

The Mariposa taxadjunct consists of shallow or moderately deep, well drained soils that formed in material weathered from metamorphic rocks. These soils are on metamorphic Sierra Nevada mountains. Slopes range from 2 to 75 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, parasesquic, mesic Typic Haploxerults

Typical Pedon

Mariposa gravelly loam. (Colors are for dry soil unless otherwise noted.)

Oi—2 inches to 0 (5 cm to 0); partially decomposed leaves, twigs, and needles.

A—0 to 4 inches (0 to 10 cm); brown (7.5YR 5/4) gravelly loam, reddish brown (5YR 3/4) moist; strong medium granular structure; soft, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine irregular pores; 20 percent gravel and 5 percent cobbles; neutral; clear smooth boundary.

Bt1—4 to 10 inches (10 to 25 cm); reddish brown (5YR 5/4) gravelly loam, dark reddish brown (5YR 3/4) moist; moderate medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine to medium roots; common very fine irregular and many very fine and fine tubular pores; 20 percent gravel and 5 percent cobbles; few thin clay films lining pores; moderately acid; clear smooth boundary.

Bt2—10 to 17 inches (25 to 43 cm); yellowish red (5YR 4/6) gravelly loam, dark red (2.5YR 3/6) moist; weak medium subangular blocky structure; slightly hard, very

friable, slightly sticky, slightly plastic; many very fine to medium and common coarse roots; common very fine and fine tubular pores; common thin clay films in pores; 20 percent gravel and 5 percent cobbles; moderately acid; clear smooth boundary.

Bt3—17 to 23 inches (43 to 58 cm); yellowish red (5YR 5/6) gravelly clay loam, dark red (2.5YR 3/6) moist; weak medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to coarse roots; common fine tubular pores; 20 percent gravel and 5 percent cobbles; common thin clay films on faces of peds and in pores; moderately acid; abrupt smooth boundary.

R—23 inches (58 cm); gray (10YR 6/1), indurated schist bedrock; tilted about 80 degrees from horizontal.

Type location: Yuba County, California; about 0.6 mile northeast of Challenge, approximately 600 feet south and 1,500 feet east of the northwest corner of sec. 20, T. 19 N., R. 7 E.; 39 degrees, 29 minutes, 46 seconds north latitude and 121 degrees, 12 minutes, 57 seconds west longitude; NAD27; USGS Quad: Challenge, California.

Range in Characteristics

The depth to lithic bedrock ranges from 15 to 35 inches (38 to 89 cm). It varies over very short distances. The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July 1 to October 15 (about 85 days). Mineralogy is mixed. The content of organic matter is 1 to 3 percent to a depth of 6 inches (15 cm). The content of gravel is 15 to 25 percent, the content of cobbles is 0 to 10 percent, and the content of stones is 0 to 10 percent.

The A horizon has dry color of 7.5YR 5/4, 5/6, or 4/4. Moist color is 7.5YR 3/4 or 5YR 3/4. Texture is gravelly or stony loam. The content of clay ranges from 10 to 20 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 5/6 or 5YR 4/4, 4/6, 5/6, or 5/8. Moist color is 5YR 3/4, 4/6, or 3/6 or 2.5YR 3/6. Texture is gravelly loam, gravelly clay loam, stony loam, or stony clay loam. The content of clay ranges from 20 to 30 percent. The absolute clay increase from the A horizon to the Bt horizon is 3 to 4 percent in 50 to 70 percent of each pedon. It is 1 to 2 percent in the remaining 30 to 50 percent of each pedon, where bedrock ledges interrupt at a shallow depth. Reaction is moderately acid.

The Mariposa taxadjunct is a taxadjunct because it has a greater quantity of free iron oxides and carbon in the Bt horizon than is defined as the range for the series and has parasesquic mineralogy. These differences do not significantly affect the use, management, or interpretations of the soils.

McNair Series

The McNair series consists of deep, well drained soils that formed in tephra over residuum and colluvium weathered from volcanic mudflow. These soils are on lahar over narrow basalt plateaus on volcanic Sierra Nevada mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 50 degrees F (10 degrees C.)

Taxonomic class: Medial-skeletal, amorphic, frigid Humic Haploxerands

Typical Pedon

McNair medial coarse sandy loam, on a west-facing slope of 5 percent, under a cover of mixed conifers and shrubs, at an elevation of 4,960 feet (1,512 m). When described

on 7/23/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 3 inches (0 to 8 cm); partially decomposed litter of needles, leaves, cones, and twigs.

A1—3 to 6 inches (8 to 15 cm); very dark grayish brown (10YR 3/2) medial coarse sandy loam, black (10YR 2/1) moist; 5 percent clay; weak very fine granular structure; loose, very friable, nonsticky, nonplastic; common fine roots; many very fine irregular pores; extremely hydrophobic; 12 percent subrounded andesite gravel; neutral, pH 6.7 by Hellige-Truog; NaF pH 11.7; abrupt smooth boundary.

A2—6 to 16 inches (15 to 41 cm); dark grayish brown (10YR 4/2) gravelly medial coarse sandy loam, black (10YR 2/1) moist; 10 percent clay; weak very fine subangular blocky structure parting to weak fine granular; loose, very friable, nonsticky, nonplastic; common fine to coarse roots; many very fine irregular pores; moderately hydrophobic, smeary; 10 percent rounded andesite gravel and 5 percent rounded andesite stones; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 11.5; clear smooth boundary.

Bw1—16 to 25 inches (41 to 63 cm); brown (7.5YR 5/3) very gravelly medial sandy loam, brown (7.5YR 4/2) moist; 12 percent clay; weak fine subangular blocky structure parting to weak fine granular; loose, very friable, nonsticky, nonplastic; common fine and medium roots; many very fine irregular pores; smeary; 30 percent rounded andesite gravel, 5 percent rounded volcanic mudflow cobbles, and 5 percent rounded andesite stones; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 11.5; clear wavy boundary.

Bw2—25 to 33 inches (63 to 84 cm); brown (7.5YR 5/3) very gravelly medial sandy loam, brown (7.5YR 4/2) moist; 15 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common fine and medium roots; many very fine irregular pores; 35 percent rounded andesite gravel and 5 percent subrounded volcanic mudflow gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 11.3; clear wavy boundary.

Bw3—33 to 48 inches (84 to 122 cm); brown (7.5YR 5/3) very gravelly medial sandy loam, brown (7.5YR 4/3) moist; 16 percent clay; weak very fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; many fine and medium and few coarse roots; many very fine irregular pores; smeary; 30 percent rounded andesite gravel, 5 percent rounded andesite cobbles, 5 percent rounded andesite stones, and 15 percent subrounded volcanic mudflow gravel; very strongly acid, pH 4.7 by Hellige-Truog; NaF pH 10.7; abrupt smooth boundary.

BC—48 to 57 inches (122 to 145 cm); pale brown (10YR 6/3) extremely gravelly coarse sandy loam, brown (10YR 4/3) moist; 8 percent clay; weak very fine granular structure; loose, very friable, nonsticky, nonplastic; common fine and medium roots; many very fine irregular pores; 60 percent rounded andesite gravel and 20 percent subrounded volcanic mudflow gravel; very strongly acid, pH 5.0 by Hellige-Truog; NaF pH 10.5; clear smooth boundary.

Cr—57 to 88 inches (145 to 223 cm); moderately cemented volcanic mudflow; few medium roots in horizontal fractures about 8 to 12 inches apart; few pockets of highly weathered volcanic mudflow.

Type location: Plumas County, California; about 2.4 miles east of Cascade, approximately 650 feet east and 1,200 feet south of the northwest corner of sec. 7, T. 21 N., R. 8 E.; 39 degrees 41 minutes 51.4 seconds north latitude and 121 degrees 8 minutes 3.3 seconds west longitude; NAD83; USGS Quad: Cascade, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C.) The soil moisture

control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 10 to 18 percent clay and 35 to 50 percent rock fragments, mostly gravel and cobbles. Mineralogy is amorphic. By ammonium acetate, base saturation ranges from 10 to 35 percent. P retention is more than 95 percent to a depth of 33 inches (84 cm). Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders. Some pedons do not have a BC horizon.

The A horizon has dry color of 10YR 3/2, 4/2, 4/3, or 5/3. Moist color is 10YR 2/1, 2/2, or 3/2 or 7.5YR 3/2 or 3/3. Texture is dominantly medial coarse sandy loam and gravelly medial coarse sandy loam, but in some pedons it is very gravelly medial sandy loam or gravelly medial silt loam. The content of clay ranges from 5 to 12 percent. The horizon has 5 to 20 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 9 to 36 percent. Acid oxalate extractable Al plus $^1/_2$ Fe ranges from 2.9 to 3.5. NaF pH is 11.0 to 12.0. Reaction ranges from strongly acid to neutral.

The Bw horizon has dry color of 7.5YR 5/3, 6/4, or 7/4 or 10YR 4/3, 5/4, 6/3, 6/4, 7/3, 7/4, or 8/3. Moist color is 7.5YR 3/4, 4/2, 4/3, 4/4, or 5/4 or 10YR 2/2, 4/3, 4/4, 6/6, or 8/4. Texture is very gravelly medial sandy loam, extremely gravelly medial sandy loam, extremely gravelly medial coarse sandy loam, very gravelly medial loam, extremely gravelly medial loam, or extremely gravelly medial sandy clay loam. The content of clay ranges from 10 to 25 percent. The horizon has 35 to 50 percent gravel, 0 to 30 percent cobbles, and 0 to 10 percent stones. Pararock fragments consist of a weathered volcanic mudflow matrix. The content of paragravel is 5 to 15 percent, and the content of paracobbles is 0 to 5 percent. The content of organic matter is 6 to 9 percent. Acid oxalate extractable Al plus $^1/_2$ Fe ranges from 1.7 to 2.5. The content of glass ranges from 10 to 29 percent. NaF pH is 10.5 to 11.5. Reaction ranges from very strongly acid to slightly acid.

The BC horizon has dry color of 10YR 6/3 or 7/4. Moist color is 10YR 4/3 or 5/4. Texture is extremely gravelly sandy loam, extremely gravelly coarse sandy loam, extremely gravelly loam, or extremely gravelly sandy clay loam. The content of clay ranges from 8 to 25 percent. The horizon has 60 to 80 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones. The content of paragravel is 20 to 30 percent. The content of organic matter is 4 to 6 percent. NaF pH is 10.5 to 11.0. Reaction is very strongly acid or strongly acid.

Mildred Series

The Mildred series consists of moderately deep, well drained soils that formed in material weathered from basic intrusive igneous rocks. These soils are on plutons in the Sierra Nevada Mountains. Slopes range from 3 to 50 percent. The mean annual precipitation is about 45 inches (114 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Fine, mixed, active, mesic Ultic Haploxeralfs

Typical Pedon

Mildred cobbly loam, on a northeast-facing slope of 18 percent, under a cover of whiteleaf manzanita, scattered ponderosa pine, and foothill pine, at an elevation of 1,670 feet (509 m). When described on 8/28/1985, the soil was dry throughout. (Colors are for dry soil unless otherwise noted).

A—0 to 3 inches (0 to 8 cm); pale brown (10YR 6/3) cobbly loam, dark yellowish brown (10YR 4/4) moist; moderate medium granular structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine and few fine roots; common

very fine irregular and few very fine tubular pores; 20 percent cobbles, 10 percent gravel, and 3 percent stones; slightly acid, pH 6.2; clear wavy boundary.

Bt—3 to 9 inches (8 to 23 cm); light brown (7.5YR 6/4) cobbly clay loam, brown (7.5YR 4/4) moist; weak medium subangular blocky structure; slightly hard, friable, sticky, plastic; common very fine and few fine roots; common very fine tubular pores; few thin clay films on faces of peds and common moderately thick clay films in pores; 20 percent cobbles, 10 percent gravel, and 3 percent stones; slightly acid, pH 6.4; abrupt smooth boundary.

2Bt1—9 to 15 inches (23 to 38 cm); reddish brown (5YR 4/4) clay, yellowish red (5YR 4/6) moist; strong medium prismatic structure parting to weak medium subangular blocky; hard, firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; common pressure faces; neutral, pH 6.8; clear smooth boundary.

2Bt2—15 to 20 inches (38 to 51 cm); brown (10YR 5/3) clay, dark brown (10YR 4/3) moist; strong medium prismatic structure parting to weak medium subangular blocky; very hard, very firm, very sticky, very plastic; few very fine roots; common very fine tubular pores; common pressure faces; neutral, pH 7.0; clear smooth boundary.

2BCt—20 to 23 inches (51 to 58 cm); reddish yellow (7.5YR 6/6) clay loam, strong brown (7.5YR 5/6) moist; strong medium prismatic structure parting to weak medium subangular blocky; very hard, very firm, very sticky, very plastic; few very fine and medium roots; common very fine tubular pores; few pressure faces; common moderately thick clay films on faces of peds and many moderately thick clay films in pores; neutral, pH 7.0; abrupt wavy boundary.

2Cr—23 inches (58 cm); mixed reddish yellow (7.5YR 7/8), light gray (10YR 7/1), and white (10YR 8/1), weathered norite.

Type location: Yuba County, California; about 0.75 mile north of Oregon House on Frenchtown Road, then northwest about l mile in the Thousand Trails Campground, approximately 2,550 feet south and 1,850 feet west of the northeast corner of sec. 35, T. 18 N., R. 6 E.; 39 degrees, 22 minutes, 31 seconds north latitude and 121 degrees, 15 minutes, 54 seconds west longitude; NAD27; USGS Quad: Rackerby, California.

Range in Characteristics

The depth to paralithic bedrock ranges from 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 52 to 56 degrees F (11 to 13 degrees C). The soil temperature is below 47 degrees (8 degrees C) from January 1 to February 31. The soil moisture control section is dry in all parts from June 15 to October 31 and is moist in some or all parts from November 1 to June 15.

The A horizon has dry color of 10YR 6/3 or 7.5YR 5/6, 5/4, or 5/3. Moist color is 10YR 4/4 or 3/4 or 7.5YR 3/4. The content of clay ranges from 18 to 27 percent. The content of rock fragments ranges from 15 to 35 percent, including 0 to 5 percent stones, 5 to 25 percent cobbles, and 10 to 25 percent gravel. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 10YR 6/4 or 7.5YR 7/4, 6/4, 5/4, or 5/3. Moist color is 10YR 4/3 or 7.5YR 4/6, 4/4, 4/3, or 3/4. The content of clay ranges from 27 to 35 percent. The content of rock fragments ranges from 15 to 35 percent, including 0 to 5 percent stones, 5 to 25 percent cobbles, and 10 to 25 percent gravel. Reaction is slightly acid or neutral. Base saturation is 50 to 75 percent in some part of the horizon.

The 2Bt horizon has dry color of 10YR 5/3; 7.5YR 6/6, 6/4, 5/5, or 5/4; or 5YR 5/6, 5/4, or 4/4. Moist color is 10YR 4/3; 7.5YR 5/6, 4/4, or 3/4; or 5YR 4/6 or 4/4. The horizon has an abrupt upper boundary. Texture is clay loam or clay. The content of clay ranges from 35 to 60 percent. The absolute clay increase from the Bt horizon to the 2Bt horizon is 15 to 30 percent. The content of rock fragments ranges from 0 to

15 percent, including 0 to 15 percent cobbles and 0 to 15 percent gravel. Reaction is slightly acid or neutral. Base saturation is 75 to 95 percent.

Millerridge Series

The Millerridge series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from ultramafic rocks. These soils are on ridgetops and side slopes on ultramafic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 52 inches (1,321 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

Typical Pedon

Millerridge gravelly sandy clay loam, on a south-facing slope of 15 percent, under a cover of yellow starthistle, buckbrush, whiteleaf manzanita, and toyon, at an elevation of 2,180 feet (664 m). When described on 10/24/2000, the soil was moderately dry to a depth of 12 inches (30 cm) and dry below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light brown (7.5YR 6/4) gravelly sandy clay loam, brown (7.5YR 4/3) moist; 23 percent clay; moderate fine and medium granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to medium tubular and irregular pores; 5 percent stones, 5 percent cobbles, and 7 percent gravel; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); reddish yellow (7.5YR 7/6) stony sandy clay loam, strong brown (7.5YR 4/6) moist; 28 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine to medium tubular pores; 60 percent continuous faint clay films; 5 percent stones, 5 percent cobbles, and 5 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Bt2—6 to 12 inches (15 to 30 cm); reddish yellow (5YR 6/6) cobbly clay loam, yellowish red (5YR 4/6) moist; 32 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 90 percent continuous distinct clay films; 5 percent stones, 5 percent gravel, and 10 percent cobbles; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt3—12 to 20 inches (30 to 51 cm); reddish yellow (5YR 6/6) cobbly clay loam, yellowish red (5YR 4/6) moist; 36 percent clay; strong fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; many very fine to medium tubular pores; 90 percent continuous distinct clay films; 5 percent stones, 8 percent gravel, and 10 percent cobbles; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt4—20 to 26 inches (51 to 67 cm); reddish yellow (5YR 6/6) gravelly clay, yellowish red (5YR 5/6) moist; 40 percent clay; strong fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; few very fine to coarse roots; many very fine to medium and common coarse tubular pores; 90 percent continuous distinct clay films; 5 percent stones, 5 percent cobbles, and 8 percent gravel; neutral, pH 6.7 by Hellige-Truog; abrupt smooth boundary.

Crt—26 inches (67 cm); light greenish gray (5GY 7/1), weakly cemented ultramafic bedrock, light greenish gray (5G 7/1) moist; few very fine and fine roots; 20 percent continuous distinct clay films; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 1.12 miles east of Concow School, approximately 600 feet north and 800 feet west of the southeast corner of sec. 27, T. 22 N., R. 4 E.; 39 degrees, 43 minutes, 39 seconds north latitude and 121 degrees, 30 minutes, 28 seconds west longitude; NAD83; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 54 to 59 degrees F (12 to 15 degrees C). The particle-size control section averages 27 to 35 percent clay and 15 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed but is affected by a high content of magnesium-rich minerals in the series control section. Rock fragments on the surface range from 0 to 60 percent gravel, 0 to 30 percent cobbles, 0 to 20 percent stones, and 0 to 15 percent boulders.

The A horizon has dry color of 7.5YR 6/4, 7/3, or 7/6. Moist color is 7.5YR 4/3 or 5/4 or 5YR 4/6. Texture is gravelly sandy clay loam or gravelly loam. The content of clay ranges from 20 to 27 percent. The horizon has 7 to 25 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 7.5YR 6/6, 7/4, or 7/6 or 5YR 6/6. Moist color is 7.5YR 4/6, 5/4, or 5/6 or 5YR 4/6 or 5/6. Texture is gravelly clay loam, cobbly clay loam, stony sandy clay loam, gravelly sandy clay loam, or cobbly sandy clay loam. The content of clay ranges from 27 to 35 percent. The content of gravel is 5 to 30 percent, the content of cobbles is 0 to 20 percent, the content of stones is 0 to 5 percent, and the content of boulders is 0 to 5 percent. Reaction is slightly acid or neutral.

The lower part of the Bt horizon has dry color of 5YR 5/6, 6/6, or 7/6 or 7.5YR 7/6. Moist color is 5YR 4/6, 5/6, or 5/8 or 7.5YR 5/8. Texture is gravelly clay loam, cobbly clay loam, very cobbly clay loam, cobbly sandy clay loam, gravelly clay, or cobbly clay. The content of clay ranges from 30 to 50 percent. The content of gravel is 5 to 30 percent, the content of cobbles is 5 to 25 percent, the content of stones is 0 to 5 percent, and the content of boulders is 0 to 5 percent. Reaction is slightly acid or neutral.

Minniecreek Series

The Minniecreek series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from metavolcanic rocks, mainly greenschist. These soils are on metamorphic Sierra Nevada foothills. Slopes range from 2 to 70 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Fine-loamy, mixed, active, mesic Ultic Haploxeralfs

Typical Pedon

Minniecreek loam, on a north-facing slope of 43 percent, under a cover of whiteleaf manzanita, interior live oak, Pacific madrone, ponderosa pine, and California black oak, at an elevation of 2,160 feet (658 m). When described on 8/17/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light yellowish brown (10YR 6/4) loam, dark yellowish brown (10YR 4/4) moist; 20 percent clay; strong medium granular structure; slightly hard, friable, nonsticky, slightly plastic; many fine roots; many very fine

irregular pores; 10 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

BAt—2 to 8 inches (5 to 20 cm); very pale brown (10YR 7/4) loam, brown (7.5YR 5/4) moist; 22 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; common fine and few medium roots; common very fine tubular pores; 5 percent discontinuous distinct clay films on faces of peds; 5 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—8 to 15 inches (20 to 38 cm); pink (7.5YR 7/4) loam, strong brown (7.5YR 4/6) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine and few medium roots; common very fine tubular pores; 15 percent discontinuous distinct clay films on faces of peds; 5 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt2—15 to 24 inches (38 to 61 cm); light reddish brown (5YR 6/4) silty clay loam, yellowish red (5YR 4/6) moist; 30 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common fine and few medium roots; common very fine tubular pores; 10 percent continuous distinct clay films on surfaces along pores and 20 percent continuous distinct clay films on faces of peds; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

BCt—24 to 32 inches (61 to 81 cm); reddish yellow (7.5YR 7/6) silty clay loam, strong brown (7.5YR 5/6) moist; 37 percent clay; moderate fine subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; few fine and medium and common coarse roots; many fine tubular pores; 20 percent continuous distinct clay films on faces of peds; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

Crt1—32 to 47 inches (81 to 119 cm); moderately cemented, weathered greenschist; common fine and few medium roots in cracks; 80 percent continuous prominent clay films; gradual smooth boundary.

Crt2—47 to 58 inches (119 to 147 cm); moderately cemented, weathered greenschist; common fine and few medium roots in cracks; 80 percent continuous prominent clay films; gradual wavy boundary.

Cr—58 to 75 inches (147 to 190 cm); moderately cemented greenschist bedrock; bedding plane tilted to 30 degrees; common medium roots around rocks.

Type location: Butte County, California; about 1.6 miles southeast of Bloomer Hill Lookout, approximately 1,500 feet west and 1,500 feet north of the southeast corner of sec. 31, T. 21 N., R. 5 E.; 39 degrees, 37 minutes, 47.91 seconds north latitude and 121 degrees, 27 minutes, 20.51 seconds west longitude; NAD83; USGS Quad: Berry Creek, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches. The mean annual soil temperature is 53 to 59 degrees F (12 to 14 degrees C). The soil moisture control section is dry in all parts from about June to October (about 120 days). The particle-size control section averages 25 to 30 percent clay with a silt content of as much as 50 percent, and it averages 2 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 4 percent to a depth of 15 inches (38 cm) and is less than 1 percent below that depth. By sum of cations, base saturation ranges from 39 to 50 percent to a depth of 20 inches (51 cm) and is 50 to 75 percent below that depth. Rock fragments on the surface range from 0 to 40 percent gravel, 0 to 25 percent cobbles, 0 to 15 percent stones, and 0 to 10 percent boulders. Some pedons have a BA horizon. Some do not have a BCt horizon.

The A horizon has dry color of 10YR 5/3, 6/3, or 6/4 or 7.5YR 6/4 or 7/3. Moist color is 10YR 4/3 or 4/4 or 7.5YR 4/3 or 4/4. Texture is loam or gravelly loam with a high content of silt. The content of clay ranges from 15 to 20 percent. The horizon has 5 to 30 percent gravel and 0 to 5 percent cobbles. Reaction ranges from strongly acid to slightly acid.

The BAt horizon has dry color of 10YR 6/4 or 7/4 or 7.5YR 7/3. Moist color is 5YR 6/6; 7.5YR 5/4, 5/6, or 6/4; or 10YR 4/4. Texture is loam, gravelly loam, or very gravelly loam with a high content of silt. The content of clay ranges from 18 to 22 percent. The horizon has 0 to 40 percent gravel and 0 to 5 percent cobbles. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 6/4, 6/6, 7/3, 7/4, 8/4, or 8/6 or 5YR 4/4, 6/4, or 6/6. Moist color is 7.5YR 4/4, 4/6, or 5/4 or 5YR 4/4 or 4/6. Texture is loam, gravelly loam, or clay loam with a high content of silt, or it is silty clay loam. The content of clay ranges from 24 to 30 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. Reaction is moderately acid or slightly acid.

The BCt horizon has dry color of 7.5YR 7/4 or 7/6. Moist color is 7.5YR 5/6. Texture is silty clay loam or gravelly clay loam with a high content of silt. The content of clay ranges from 29 to 37 percent. The content of gravel is 0 to 20 percent. Reaction ranges from strongly acid to slightly acid.

Moda Taxadjunct

The Moda taxadjunct consists of moderately deep, somewhat poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in swales on low terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 19 inches (483 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, active, thermic Abruptic Durixeralfs

Typical Pedon

Moda taxadjunct loam, on a southwest-facing slope of 2 percent, under a cover of annual grasses and forbs, at an elevation of 107 feet (33 m). When described on 2/8/2001, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

A1—0 to 2 inches (0 to 5 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; 10 percent clay; moderate thin platy structure; slightly hard, very friable, nonsticky, nonplastic; few fine and many very fine roots; few very fine and fine irregular pores; 5 percent fine irregular oxidized iron masses lining pores; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

A2—2 to 6 inches (5 to 15 cm); brown (10YR 5/3) loam, brown (10YR 4/3) moist; 20 percent clay; moderate fine subangular blocky structure; hard, friable, nonsticky, slightly plastic; few very fine roots; few very fine tubular pores; 2 percent very fine irregular oxidized iron masses lining pores; 10 percent well rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—6 to 13 inches (15 to 33 cm); pale brown (10YR 6/3) loam, brown (10YR 4/3) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine roots; common very fine and fine tubular pores; 20 percent discontinuous distinct clay films; 5 percent well rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

2Bt2—13 to 22 inches (33 to 56 cm); brown (7.5YR 5/4) clay, brown (7.5YR 5/3) moist; 45 percent clay; weak medium prismatic structure parting to moderate fine angular blocky; very hard, very firm, very sticky, very plastic; few very fine roots;

few very fine tubular pores; 50 percent continuous distinct clay films; 2 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

2Bkqm—22 inches (56 cm); indurated duripan; cemented by silica; common very fine roots on top of the horizon; 15 percent very fine irregular manganese masses at the top of the horizon; strongly effervescent.

Type location: Butte County, California; about 3.4 miles southeast of the Rancho Llano Seco headquarters, approximately 300 feet east of the Mt. Diablo meridian and 11,260 feet north of the Butte-Glenn County line; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 34 minutes, 3 seconds north latitude and 121 degrees, 54 minutes, 47 seconds west longitude; NAD27; USGS Quad: Llano Seco, California.

Range in Characteristics

Depth to an indurated duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 35 to 50 percent clay and 2 to 10 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is estimated to be 0.5 to 0.8 percent to a depth of 6 inches (15 cm) and less than 0.5 percent below that depth. By sum of cations, base saturation is assumed to be more than 75 percent throughout the profile. A fluctuating water table can occur between the top of the duripan and the surface of the soil from December through April. Redoximorphic features, such as soft oxidized iron masses with color of 7.5YR 4/4, 4/6, or 5/6 and manganese masses with color of N 2/0, occur throughout the profile. Rock fragments on the surface range from 0 to 10 percent gravel.

The A horizon has dry color of 10YR 5/2, 5/3, or 6/3. Moist color is 10YR 3/2, 3/3, or 4/3. Texture is loam. The content of clay ranges from 10 to 20 percent. The content of gravel is 5 to 10 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 10YR 6/2 or 6/3 or 7.5YR 6/4. Moist color is 10YR 3/4, 4/2, or 4/3 or 7.5YR 5/4. Texture is loam, sandy clay loam, or clay loam. The content of clay ranges from 24 to 30 percent. The content of gravel is 5 to 10 percent. Reaction is slightly acid or neutral.

The 2Bt horizon has dry color of 7.5YR 5/4 or 6/4. Moist color is 7.5YR 4/4, 5/3, or 5/4. Texture is clay. The content of clay ranges from 45 to 50 percent. The content of gravel is 0 to 10 percent. Reaction ranges from neutral to moderately alkaline.

The 2Bkqm horizon has dry color of 10YR 7/4. Moist color is 10YR 4/4 or 4/6. An indurated silica and lime capping ranges from 0.06 to 0.12 inch in thickness.

Some pedons have a flood deposit of silt loam about 0.25 inch (0.6 cm) thick on the surface.

The Moda taxadjunct is a taxadjunct because the mineralogy is most likely mixed rather than vermiculitic. This difference does not significantly affect the use, management, or interpretations of the soils.

Mounthope Series

The Mounthope series consists of deep, well drained soils that formed in colluvium and residuum derived from metasedimentary rocks, metavolcanic rocks (mainly greenschist), and intrusive igneous rocks (mainly quartz diorite and gabbro). These soils are on ridgetops and side slopes on Sierra Nevada foothills. Slopes range from 2 to 100 percent. The mean annual precipitation is about 43 inches (1,092 mm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Mounthope loam, on a southeast-facing slope of 27 percent, under a cover of whiteleaf manzanita, toyon, buckbrush, interior live oak, blue oak, foothill pine, and Pacific poison oak, at an elevation of 1,640 feet (500 m). When described on 11/20/2000, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material.

A—1 to 3 inches (3 to 8 cm); brown (7.5YR 5/4) loam, reddish brown (5YR 4/4) moist; 20 percent clay; moderate medium subangular blocky structure parting to moderate fine granular; slightly hard, very friable, nonsticky, slightly plastic; few very fine roots; common fine and medium irregular pores; 5 percent subangular metavolcanic gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—3 to 7 inches (8 to 18 cm); yellowish red (5YR 5/6) loam, reddish brown (5YR 4/4) moist; 24 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine, few medium, and many coarse roots; common fine and few medium tubular pores; 5 percent discontinuous distinct clay films on surfaces along pores and 20 percent discontinuous distinct clay films on faces of peds; 10 percent subangular metavolcanic gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt smooth boundary.

Bt2—7 to 15 inches (18 to 38 cm); yellowish red (5YR 5/6) loam, reddish brown (5YR 4/4) moist; 26 percent clay; moderate medium subangular blocky structure; hard, friable, slightly sticky, moderately plastic; common fine and medium and few coarse roots throughout; common fine tubular pores; 10 percent discontinuous distinct clay films on surfaces along pores and 20 percent discontinuous distinct clay films on all faces of peds; 5 percent subangular metavolcanic gravel; slightly acid, pH 6.2 by Hellige-Truog; clear wavy boundary.

Bt3—15 to 22 inches (38 to 56 cm); yellowish red (5YR 5/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 28 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; few fine and medium roots; common fine and medium tubular pores; 10 percent discontinuous distinct clay films on surfaces along pores and 25 percent discontinuous distinct clay films on faces of peds; 25 percent subangular metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; gradual wavy boundary.

Bt4—22 to 26 inches (56 to 66 cm); yellowish red (5YR 5/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 29 percent clay; moderate fine subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine and medium roots; few fine tubular pores; 10 percent discontinuous distinct clay films on surfaces along pores and 35 percent discontinuous distinct clay films on faces of peds; 30 percent subangular metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; gradual wavy boundary.

Bt5—26 to 31 inches (66 to 79 cm); yellowish red (5YR 5/6) very gravelly clay loam, yellowish red (5YR 4/6) moist; 31 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine and medium roots; common fine and medium tubular pores; 15 percent discontinuous distinct clay films on surfaces along pores and 35 percent discontinuous distinct clay films on faces of peds; 50 percent subangular metavolcanic gravel; slightly acid, pH 6.4 by Hellige-Truog; gradual wavy boundary.

Bt6—31 to 42 inches (79 to 107 cm); yellowish red (5YR 5/6) very gravelly clay loam, yellowish red (5YR 4/6) moist; 28 percent clay; moderate fine subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; few fine roots; few fine tubular pores; 10 percent discontinuous distinct clay films on surfaces along pores and 35 percent discontinuous distinct clay films on faces of peds; 50

percent subangular metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bt7—42 to 52 inches (107 to 132 cm); reddish yellow (5YR 6/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 30 percent clay; weak fine subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; few fine roots; few fine tubular pores; 5 percent discontinuous distinct clay films on surfaces along pores and 15 percent discontinuous distinct clay films on faces of peds; 30 percent subangular metavolcanic gravel; slightly acid, pH 6.4 by Hellige-Truog; gradual smooth boundary.

Cr—52 inches (132 cm); moderately cemented greenschist bedrock.

Type location: Butte County, California; about 5.1 miles northeast of Oroville Dam, approximately 1,600 feet east and 1,050 feet south of the northwest corner of sec. 7, T. 20 N., R. 5 E.; 39 degrees, 36 minutes, 34.15 seconds north latitude and 121 degrees, 27 minutes, 33.20 seconds west longitude; NAD83; USGS Quad: Oroville Dam, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 59 to 63 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 200 days). The particle-size control section averages 20 to 27 percent clay and 10 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 3.5 percent to a depth of 15 inches (38 cm) and less than 1 percent from 15 to 52 inches (38 to 132 cm). Rock fragments on the surface range from 0 to 15 percent gravel, 0 to 10 percent cobbles, 0 to 15 percent stones, and 0 to 15 percent boulders.

The A horizon has dry color of 7.5YR 5/4, 6/4, 7/4, or 5/6 or 5YR 7/6. Moist color is 5YR 4/4 or 5/4 or 7.5YR 3/4 or 4/3. Texture is loam or gravelly loam with a high content of silt. The content of clay ranges from 17 to 25 percent. The content of gravel is 0 to 30 percent. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 5YR 5/6 or 7.5YR 5/6. Moist color is 5YR 4/4 or 7.5YR 3/4. Texture is gravelly loam or loam. The content of clay ranges from 20 to 27 percent. The content of gravel is 0 to 10 percent. Reaction is slightly acid or moderately acid.

The lower part of the Bt horizon has dry color of 5YR 7/4, 4/6, 5/6, 6/6, or 7/6; 7.5YR 5/6, 6/6, 7/6, or 7/4; or 2.5YR 5/6, 6/6, or 7/6. Moist color is 5YR 3/4, 4/4, 4/6, 5/6, 5/8, or 8/4; 7.5YR 3/4, 4/4, or 4/6; or 2.5YR 4/6, 4/8, or 5/8. Texture is clay loam, very gravelly loam, gravelly clay loam, or very gravelly clay loam with a high content of silt. The content of clay ranges from 20 to 35 percent. The content of gravel is 5 to 50 percent, and the content of cobbles is 0 to 25 percent. Reaction is moderately acid or slightly acid.

The BCt horizon, where it occurs, has dry color of 7.5YR 5/6. Moist color is 5YR 4/6. Texture is extremely gravelly loam, extremely gravelly clay loam, or extremely gravelly clay with a high content of silt. The content of clay ranges from 25 to 27 percent in the upper part of the horizon and from 25 to 40 percent in the lower part. The horizon has 60 to 70 percent gravel and 0 to 20 percent cobbles. Reaction is moderately acid or slightly acid.

Mountyana Series

The Mountyana series consists of very deep, well drained soils that formed in weathered tephra over residuum derived from volcanic rocks. These soils are on volcanic ridges in the Cascade Mountains. Slopes range from 2 to 30 percent. The

mean annual precipitation is about 72 inches (1,829 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Fine-loamy, isotic, mesic Andic Haplohumults

Typical Pedon

Mountyana gravelly loam, on a southeast-facing slope of 10 percent, under a cover of mixed conifers, at an elevation of 3,640 feet (1,110 m). When described on 11/27/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted).

Oi—0 to 1 inch (0 to 3 cm); pine litter.

Oe—1 to 2 inches (3 to 5 cm); partially decomposed pine litter.

A—2 to 5 inches (5 to 13 cm); reddish brown (5YR 5/4) gravelly loam, dark reddish brown (5YR 3/3) moist; 22 percent clay; strong fine and medium granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine to medium roots; many very fine to coarse irregular pores; noneffervescent; 1 percent cobbles and 30 percent gravel; moderately acid, pH 5.9 by pH meter 1:1 water; NaF pH 10.4; clear smooth boundary.

Bt1—5 to 9 inches (13 to 23 cm); reddish brown (5YR 5/4) gravelly loam, dark reddish brown (5YR 3/4) moist; 24 percent clay; strong fine and medium granular structure; slightly hard, friable, slightly sticky, moderately plastic; many very fine to medium roots; many very fine to coarse irregular pores; many distinct discontinuous clay films on faces of peds; noneffervescent; 2 percent cobbles and 18 percent gravel; moderately acid, pH 5.8 by pH meter 1:1 water; NaF pH 10.1; clear smooth boundary.

Bt2—9 to 14 inches (23 to 36 cm); reddish brown (5YR 5/4) gravelly clay loam, reddish brown (5YR 4/4) moist; 28 percent clay; moderate fine and medium granular structure; moderately hard, firm, slightly sticky, moderately plastic; many very fine to medium and common coarse roots; many very fine to coarse irregular pores; many distinct discontinuous clay films on faces of peds; noneffervescent; 2 percent cobbles and 18 percent gravel; moderately acid, pH 5.8 by meter 1:1 water; NaF pH 9.9; clear smooth boundary.

Bt3—14 to 19 inches (36 to 48 cm); reddish brown (5YR 5/4) gravelly clay loam, yellowish red (5YR 4/6) moist; 30 percent clay; moderate medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine, fine, and coarse and many medium roots; many very fine to coarse irregular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 2 percent cobbles and 15 percent gravel; moderately acid, pH 5.7 by pH meter 1:1 water; NaF pH 9.9; clear smooth boundary.

Bt4—19 to 26 inches (48 to 66 cm); brown (7.5YR 5/4) gravelly clay loam, yellowish red (5YR 4/6) moist; 33 percent clay; moderate medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine to coarse roots; many very fine and fine and common medium and coarse irregular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 2 percent cobbles and 15 percent gravel; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 9.9; clear smooth boundary.

Bt5—26 to 38 inches (66 to 97 cm); brown (7.5YR 5/4) gravelly clay loam, yellowish red (5YR 4/6) moist; 33 percent clay; strong medium and coarse subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few very fine, fine, and coarse and common medium roots; many very fine and fine and common medium and coarse tubular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 2 percent cobbles and 20 percent gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.9; clear irregular boundary.

Bt/Cr—38 to 53 inches (97 to 135 cm); brown (7.5YR 5/4) extremely gravelly clay loam, strong brown (7.5YR 4/6) moist; 28 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine and fine and common medium tubular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 40 percent gravel, 20 percent cobbles, and 10 percent stones; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.6; clear smooth boundary.

Cr/Bt—53 to 66 inches (135 to 168 cm); brown (7.5YR 5/4) extremely gravelly loam, strong brown (7.5YR 4/6) moist; 24 percent clay; weak fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine and fine and common medium tubular pores; few distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 30 percent gravel, 20 percent cobbles, and 20 percent stones; strongly acid, pH 5.2 by pH meter 1:1 water; NaF pH 9.6; clear irregular boundary.

Cr—66 to 72 inches (168 to 183 cm); moderately cemented mudflow breccia; few very fine and fine roots; common very fine and fine tubular pores; cracks occurring more than 4 inches (10 cm) apart.

Type location: Butte County, California; about 1 mile east-southeast of Ewalt Camp, approximately 100 feet south and 1,500 feet west of the northeast corner of sec. 2, T. 24 N., R. 3 E.; 39 degrees, 58 minutes, 26.4 seconds north latitude and 121 degrees, 36 minutes, 7.2 seconds west longitude; NAD27; USGS Quad: Stirling, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 54 to 56 degrees F (12 to 13 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 18 to 35 percent clay and 2 to 25 percent rock fragments, mostly gravel. Mineralogy is isotic. Acid oxalate extractable Al plus ½ Fe ranges from 1.88 to 1.61 to a depth of 9 inches (23 cm). Rock fragments on the surface range from 5 to 30 percent gravel.

The A horizon has dry color of 7.5YR 4/4, 6/3, or 6/4 or 5YR 5/4 or 6/6. Moist color is 5YR 3/2, 3/3, or 3/4 or 7.5YR 3/3, 3/4, or 4/3. Texture is gravelly loam, gravelly sandy loam, loam, or sandy loam. The content of clay ranges from 15 to 25 percent. The horizon has 2 to 30 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 6 to 10 percent. By sum of cations, base saturation ranges from 25 to 35 percent. By ammonium acetate, CEC ranges from 20 to 30. NaF pH is 9.8 to 11. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 5YR 5/4, 5/6, 6/4, or 6/6 or 7.5YR 5/4 or 6/6. Moist color is 5YR 3/3, 3/4, 4/4, 4/6, 5/4, 5/6, or 6/4 or 2.5YR 3/4, 4/4, or 4/6. Texture is gravelly loam, gravelly clay loam, loam, or clay loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 2 to 20 percent, and the content of cobbles is 0 to 2 percent. The content of organic matter is 1 to 5 percent. By sum of cations, base saturation ranges from 30 to 37 percent. By ammonium acetate, CEC ranges from 14 to 22. NaF pH is 9.5 to 10.5. Reaction is moderately acid or slightly acid.

The lower part of the Bt horizon has dry color of 5YR 5/4, 5/6, 6/4, or 6/6; 7.5YR 5/4 or 6/6; or 10YR 6/6. Moist color is 5YR 4/4, 4/6, 5/4, 5/6, or 6/4; 7.5YR 4/4 or 5/6; or 10YR 4/4. Texture is gravelly clay loam, gravelly loam, gravelly sandy loam, clay loam, loam, or sandy loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 2 to 25 percent, and the content of cobbles is 0 to 5 percent. The content of organic matter is 0.5 to 1 percent. By sum of cations, base saturation ranges from 19 to 26 percent. By ammonium acetate, CEC ranges from 10 to 15. NaF pH is 9.5 to 10. Reaction ranges from very strongly acid to slightly acid.

The Bt/Cr horizon has dry color of 7.5YR 5/4 or 10YR 7/6. Moist color is 7.5YR 4/6 or 10YR 6/8. Texture is extremely gravelly clay loam, very gravelly clay loam, extremely gravelly loam, very gravelly loam, or very cobbly loam. The content of clay ranges from 18 to 30 percent. The horizon has 20 to 50 percent gravel, 20 to 50 percent cobbles, and 0 to 20 percent stones. The content of organic matter is 0.1 to 1 percent. By sum of cations, base saturation ranges from 5 to 10 percent. By ammonium acetate, CEC ranges from 10 to 15. NaF pH is 9.2 to 9.6. Reaction is very strongly acid or strongly acid.

The Cr/Bt horizon has dry color of 7.5YR 5/4 or 10YR 7/6. Moist color is 7.5YR 4/6 or 10YR 6/8, 5/4, or 4/3. Texture is extremely gravelly or extremely cobbly loam. The content of clay ranges from 16 to 25 percent. The horizon has 20 to 50 percent gravel, 20 to 50 percent cobbles, and 0 to 20 percent stones. The content of organic matter is 0.1 to 1 percent. By sum of cations, base saturation ranges from 5 to 10 percent. By ammonium acetate, CEC ranges from 10 to 15. NaF pH is 9.0 to 9.6. Reaction is very strongly acid or strongly acid.

Mudwash Series

The Mudwash series consists of very deep, well drained soils that formed in tephra deposited over colluvium and residuum derived from basalt. These soils are on the tops and side slopes of basalt ridges on volcanic Sierra Nevada mountains. Slopes range from 0 to 50 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Medial over loamy, mixed over isotic, mesic Alfic Humic Haploxerands

Typical Pedon

Mudwash gravelly medial sandy loam, on a southwest-facing slope of 7 percent, under a cover of mixed conifers, at an elevation of 4,650 feet (1,417 m). When described on 10/7/1997, the soil was slightly moist from a depth of 4 to 52 inches (10 to 132 cm) and dry below a depth of 52 inches (132 cm). Clay percentages are based on the apparent field texture. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 2.54 cm); fresh litter.

Oa—1 to 4 inches (2.54 to 10 cm); decomposed litter.

A1—4 to 8 inches (10 to 20 cm); brown (7.5YR 4/2) gravelly medial sandy loam, dark brown (7.5YR 3/2) moist; 10 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; common very fine to medium roots; many very fine irregular pores; 15 percent basalt gravel and 5 percent basalt cobbles; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 10.5; abrupt smooth boundary.

A2—8 to 13 inches (20 to 33 cm); brown (7.5YR 4/2) gravelly medial sandy loam, dark brown (7.5YR 3/2) moist; 12 percent clay; weak fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common coarse and many fine and medium roots; many very fine irregular pores; 20 percent basalt gravel and 5 percent basalt cobbles; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bw—13 to 26 inches (33 to 66 cm); brown (7.5YR 4/3) gravelly medial sandy loam, dark reddish brown (5YR 3/3) moist; 15 percent clay; moderate fine subangular blocky structure; loose, very friable, nonsticky, slightly plastic; common fine to coarse roots; many very fine irregular pores; 25 percent basalt gravel and 5 percent basalt cobbles; strongly acid, pH 5.1 by pH meter 1:1 water; NaF pH 10.0; clear wavy boundary.

2Bt1—26 to 35 inches (66 to 89 cm); grayish brown (10YR 5/2) gravelly loam, dark brown (7.5YR 3/2) moist; 22 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common fine to coarse roots; many very fine tubular pores; few distinct continuous clay films on faces of peds; 20 percent rounded basalt gravel; strongly acid, pH 5.1 by pH meter 1:1 water; NaF pH 9.3; clear smooth boundary.

2Bt2—35 to 52 inches (89 to 132 cm); brown (10YR 5/3) gravelly loam, dark brown (10YR 3/3) moist; 25 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and medium roots; many very fine and common fine tubular pores; common distinct continuous clay films on faces of peds; 20 percent rounded basalt gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.4; abrupt smooth boundary.

2BCt—52 to 72 inches (132 to 183 cm); brown (10YR 5/3) extremely gravelly loam, dark brown (10YR 3/3) moist; 24 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and medium roots; common very fine tubular pores; few distinct continuous clay films on faces of peds; 80 percent rounded basalt gravel; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 9.3; gradual smooth boundary.

2Cr—72 to 89 inches (183 to 226 cm); moderately cemented basalt bedrock; few fine roots; white and yellow concretions and manganese stains; no fractures.

Type location: Plumas County, California; about 1.6 miles southeast of Cascade, approximately 450 feet west and 500 feet south of the northeast corner of sec. 14, T. 21 N., R. 7 E.; 39 degrees, 41 minutes, 9.3 seconds north latitude and 121 degrees, 9 minutes, 21.9 seconds west longitude; NAD83; USGS Quad: Cascade, California.

Range in Characteristics

The depth to paralithic bedrock (basalt, mudflow, or volcaniclastic material) is more than 60 inches (152 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July to September (about 90 days). The particle-size control section averages 11 to 30 percent clay and 5 to 27 percent rock fragments in the medial part and 23 to 35 percent clay and 5 to 20 percent rock fragments in the loamy part. Mineralogy is mixed over isotic. Rock fragments on the surface range from 0 to 20 percent gravel and 0 to 25 percent cobbles. Some pedons have a C horizon and/or do not have a 2BCt horizon.

The A horizon has dry color of 10YR 4/2 or 4/3; 7.5YR 4/2, 4/3, or 4/4; or 5YR 4/6, 5/3, or 5/4. Moist color is 10YR 2/1 or 2/2, 7.5YR 3/2 or 3/3, or 5YR 3/2, 3/3, or 3/4. Texture is gravelly medial sandy loam, gravelly medial loam, medial sandy loam, or medial loam. The content of clay ranges from 8 to 18 percent. The horizon has 5 to 20 percent gravel and 5 to 10 percent cobbles. The content of organic matter is 5 to 10 percent. By sum of cations, base saturation ranges from 15 to 20 percent. NaF pH is 10.0 to 11.5. Acid oxalate extractable Al plus ½ Fe ranges from 2.2 to 2.5. P retention ranges from 90 to 92. Reaction ranges from slightly acid to strongly acid.

The Bw horizon has dry color of 7.5YR 4/3 or 5/3 or 5YR 4/6 or 5/4. Moist color is 7.5YR 3/2, 3/4, or 4/2 or 5YR 3/3, 4/3, or 4/4. Texture is gravelly medial sandy loam, gravelly medial loam, medial sandy loam, or medial loam. The content of clay ranges from 12 to 22 percent. The horizon has 5 to 25 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 5 to 9 percent. By sum of cations, base saturation ranges from 10 to 25 percent. NaF pH is 10.5 to 11. Acid oxalate extractable Al plus ½ Fe ranges from 2.0 to 2.5. P retention ranges from 85 to 90. Reaction ranges from slightly acid to very strongly acid.

The 2Bt horizon has dry color of 10YR 4/3, 5/2, 5/3, or 8/4; 7.5YR 4/3, 5/3, or 5/4; 5YR 4/4 or 4/6; or 2.5YR 4/6. Moist color is 10YR 3/3; 7.5YR 3/2, 3/3, 4/2, 4/3, or 4/6; 5YR 3/2, 3/3, 4/3, or 4/4; or 2.5YR 3/6 or 4/6. Texture is gravelly loam, loam, sandy

loam, clay loam, sandy clay loam, silty clay loam, gravelly sandy clay loam, or cobbly loam. The content of clay ranges from 18 to 38 percent. The content of gravel is 0 to 20 percent. The content of cobbles also is 0 to 20 percent. The content of organic matter is 0.8 to 5 percent. By sum of cations, base saturation ranges from 50 to 70 percent. NaF pH is 9.3 to 11.3. Acid oxalate extractable Al plus 1/2 Fe ranges from 1.0 to 1.8. P retention ranges from 55 to 70. Reaction ranges from slightly acid to extremely acid.

The 2BCt horizon has dry color of 10YR 4/2, 5/3, or 6/3 or 7.5YR 5/3 or 6/3. Moist color is 10YR 3/1, 3/3, 4/3, 4/4, or 5/2 or 7.5YR 4/2, 4/3, or 4/4. Texture is extremely gravelly loam, gravelly sandy loam, loam, coarse sandy loam, sandy clay loam, or silty clay loam. The content of clay ranges from 15 to 28 percent. The content of gravel is 5 to 80 percent. The content of organic matter is 0.8 to 1 percent. By sum of cations, base saturation ranges from 50 to 70 percent. NaF pH is 9.3 to 10.5. Acid oxalate extractable Al plus 1/2 Fe ranges from 0.7 to 1. P retention ranges from 50 to 60. Reaction ranges from moderately acid to extremely acid.

Munjar Series

The Munjar series consists of moderately deep, moderately well drained soils that formed in alluvium derived from dominantly volcanic rocks. These soils are on bars on fan terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Typic Durixeralfs

Typical Pedon

Munjar gravelly loam, on a southwest-facing slope of 1 percent, under a cover of annual grasses, at an elevation of 275 feet (84 m). When described on 4/10/1999, the soil was dry to a depth of 9 inches (23 cm) and slightly moist from 9 to 46 inches (23 to 117 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 20 percent clay; strong fine and medium subangular blocky structure parting to strong fine granular; hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine vesicular and tubular pores; 15 percent andesite gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 5 inches (5 to 13 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 23 percent clay; moderate medium platy structure parting to moderate medium and coarse subangular blocky; hard, friable, slightly sticky, slightly plastic; common very fine roots; few medium and coarse and common very fine vesicular and tubular pores; 80 percent continuous distinct clay films on faces of peds; 30 percent andesite gravel; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

Bt2—5 to 9 inches (13 to 23 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 26 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; few medium and many very fine vesicular and tubular pores; 100 percent continuous distinct clay films on faces of peds; 2 percent andesite cobbles and 15 percent andesite gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt3—9 to 16 inches (23 to 41 cm); brown (7.5YR 5/4) gravelly loam, brown (7.5YR 4/3) moist; 24 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine to medium vesicular and tubular pores; 100 percent continuous distinct clay films on faces of peds; 10 percent andesite cobbles and 20 percent andesite gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt4—16 to 22 inches (41 to 56 cm); brown (7.5YR 5/4) extremely gravelly clay loam, dark brown (7.5YR 3/4) moist; 28 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine roots; many very fine and fine and many medium vesicular and tubular pores; 100 percent continuous distinct clay films on faces of peds; 25 percent andesite cobbles and 40 percent andesite gravel; slightly alkaline, pH 7.4 by Hellige-Truog; abrupt smooth boundary.

2Btq—22 to 31 inches (56 to 79 cm); brown (7.5YR 5/4) extremely cobbly sandy clay, dark brown (7.5YR 3/4) moist; 37 percent clay; massive; very hard, firm, noncemented, moderately sticky, moderately plastic; few very fine roots; common very fine to medium vesicular and tubular pores; 100 percent continuous distinct clay films on rock fragments; 35 percent andesite cobbles and 35 percent andesite gravel; slightly alkaline, pH 7.6 by Hellige-Truog; gradual smooth boundary.

2Btqm—31 to 46 inches (79 to 117 cm); strongly cemented duripan; brown (7.5YR 5/4) extremely gravelly sandy clay loam, brown (7.5YR 4/3) moist; 27 percent clay; massive; very hard, firm, strongly cemented by silica, moderately sticky, moderately plastic; few very fine roots; common very fine and fine vesicular and tubular pores; 100 percent continuous distinct clay films on rock fragments; 5 percent andesite stones, 35 percent andesite cobbles, and 40 percent andesite gravel; slightly alkaline, pH 7.8 by Hellige-Truog.

Type location: Butte County, California; about 6.3 miles northeast of Nord, approximately 1,100 feet west and 2,300 feet south of the northeast corner of sec. 7, T. 23 N., R. 1 E.; 39 degrees, 51 minutes, 47 seconds north latitude and 121 degrees, 53 minutes, 14 seconds west longitude; NAD27; USGS Quad: Nord, California.

Range in Characteristics

Depth to the extremely gravelly duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 27 to 30 percent clay and 35 to 45 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 12 inches (30 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 5 to 30 percent gravel.

The A horizon has dry color of 7.5YR 6/4. Moist color is 7.5YR 4/3 or 5YR 3/3. Texture is gravelly loam. The content of clay ranges from 20 to 24 percent. The content of gravel is 15 to 30 percent. The content of organic matter is 2 to 5 percent. Reaction is slightly acid or neutral.

The Bt1 horizon has dry color of 7.5YR 6/4 or 6/6. Moist color is 7.5YR 4/3 or 5YR 4/3. Texture is gravelly loam. The content of clay ranges from 23 to 24 percent. The content of gravel is 15 to 30 percent. The content of organic matter is 0.8 to 1.2 percent. Reaction is slightly acid or neutral.

The Bt2, Bt3, and Bt4 horizons have dry color or 7.5YR 5/4, 6/4, or 6/6 or 5YR 5/4. Moist color is 7.5YR 3/4 or 4/3 or 5YR 4/3. Texture is gravelly loam, extremely gravelly clay loam, very gravelly loam, or very cobbly clay loam. The content of clay ranges from 24 to 35 percent. The horizons have 15 to 40 percent gravel, 2 to 40 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 0.5 to 0.8 percent. Reaction is neutral or slightly alkaline.

The 2Btq horizon has dry color of 7.5YR 5/4. Moist color is 7.5YR 3/4. Texture is extremely cobbly sandy clay. The content of clay ranges from 35 to 40 percent. The horizon has 30 to 35 percent gravel and 20 to 35 percent cobbles. The content of organic matter is 0 to 0.5 percent. Reaction is neutral or slightly alkaline.

The 2Btqm horizon has dry color of 7.5YR 5/4. Moist color is 7.5YR 3/4. Texture is extremely gravelly sandy clay loam. The content of clay ranges from 27 to 35 percent.

The horizon has 40 to 45 percent gravel, 10 to 35 percent cobbles, and 0 to 5 percent stones. Reaction is neutral or slightly alkaline.

Neerdobe Series

The Neerdobe series consists of moderately deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Duraquerts

Typical Pedon

Neerdobe clay, on a slope of less than 1 percent, under a cover of rice, at an elevation of 98 feet (30 m). When described on 5/3/1995, the soil was moist throughout. The water table was at a depth of 38 inches (97 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); dark gray (10YR 4/1) clay, dark gray (10YR 4/1) moist; 57 percent clay; moderate medium subangular blocky structure parting to strong fine granular; extremely hard, very firm, moderately sticky, very plastic; few very fine and common fine roots; few fine irregular pores; noneffervescent; moderately acid, pH 5.8 by pH meter 1:1 water; abrupt smooth boundary.

Bssg1—5 to 15 inches (13 to 38 cm); dark gray (10YR 4/1) clay, dark gray (10YR 4/1) moist; 55 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; extremely hard, very firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; continuous slickensides; common fine irregular strong brown (7.5YR 4/6) oxidized iron masses and common fine and coarse threadlike gray (10YR 6/1) iron depletions; noneffervescent; slightly alkaline, pH 7.4 by pH meter 1:1 water; clear smooth boundary.

Bssg2—15 to 23 inches (38 to 58 cm); dark gray (10YR 4/1) clay, dark gray (10YR 4/1) moist; 56 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; extremely hard, very firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; many slickensides; common fine irregular strong brown (7.5YR 4/6) oxidized iron masses and common fine threadlike gray (10YR 6/1) iron depletions; noneffervescent; moderately alkaline, pH 7.9 by pH meter 1:1 water; clear smooth boundary.

Bssg3—23 to 28 inches (58 to 71 cm); dark grayish brown (10YR 4/2) clay, dark gray (10YR 4/1) moist; 56 percent clay; moderate medium angular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; common slickensides; common fine and medium spherical carbonate concretions; common fine irregular gray (10YR 6/1) and few fine spherical gray (N 5/0 dry) iron depletions; noneffervescent; moderately alkaline, pH 8.2 by pH meter 1:1 water; abrupt smooth boundary.

Bk—28 to 33 inches (71 to 84 cm); light brownish gray (10YR 6/2) clay, grayish brown (10YR 5/2) moist; 55 percent clay; moderate fine angular blocky structure parting to strong fine angular blocky; slightly hard, friable, moderately sticky, very plastic; common very fine and few fine tubular pores; common fine irregular carbonate concretions and common fine irregular carbonate masses; common fine threadlike gray (10YR 6/1) iron depletions; strongly effervescent; strongly alkaline, pH 8.5 by pH meter 1:1 water; abrupt smooth boundary.

2Bkq—33 to 38 inches (84 to 97 cm); very pale brown (10YR 7/3) loam, brown (10YR 5/3) moist; 22 percent clay; strong thin platy structure; slightly hard, friable, weakly cemented, slightly sticky, slightly plastic; common fine and few very fine tubular pores; common fine threadlike gray (10YR 6/1 dry) iron depletions

between peds; strongly effervescent; strongly alkaline, pH 8.6 by pH meter 1:1 water; abrupt smooth boundary.

2Bkqm—38 to 56 inches (97 to 142 cm); indurated duripan; very pale brown (10YR 7/3) loam, brown (10YR 4/3) moist; 18 percent clay; strong thin platy structure; masses of silica; silica and lime threads throughout the duripan; slightly effervescent; strongly alkaline, pH 8.6 by pH meter 1:1 water.

Type location: Butte County, California; about 3 miles southwest of Nelson, approximately 2,200 feet east and 1,900 feet north of the southwest corner of sec. 7, T. 19 N., R. 2 E.; 39 degrees, 30 minutes, 48 seconds north latitude and 121 degrees, 47 minutes, 30 seconds west longitude; NAD27; USGS Quad: Nelson, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 66 degrees F (17 to 19 degrees C). The soil moisture control section is dry from June to October (120 to 125 days). The particle-size control section averages 40 to 60 percent clay. By ammonium acetate, base saturation ranges from 90 to 100 percent throughout the profile. The depth to carbonates ranges from 15 to 38 inches (38 to 97 cm). SAR is 0 to 2 throughout the profile. The content of exchangeable sodium is 1 to 4 percent throughout the profile. Electrical conductivity is 0 to 1 mmho/cm throughout the profile. Reversible, surface-initiated cracks 1 to 3 inches (2.54 to 8 cm) wide extend to a depth of 20 to 36 inches (51 to 91 cm) from May 15 to October 15 (150 days) when the soils are not irrigated. Common or many slickensides are in the Bssg horizon. A fluctuating water table can occur from the top of the duripan to the surface of the soil from December through May. Redoximorphic features, such as manganese masses with color of N 2/0, oxidized iron masses with color of 7.5YR 4/4, and matrix chromas of 2 or less, occur in the horizons above the duripan. Some pedons have few or common manganese nodules. Some have overwash of silt loam 6 to 20 inches (15 to 51 cm) thick and may have strata of silt loam, very fine sandy loam, loamy very fine sand, sandy loam, fine sandy loam, or loam with 2 to 25 percent clay. Some pedons do not have calcium carbonate.

The Ap horizon has dry color of 10YR 3/1, 4/1, 4/2, or 5/2. Moist color is 10YR 3/1, 4/1, or 3/2. Texture is clay or clay loam. The content of clay ranges from 35 to 60 percent. The content of gravel is 0 to 2 percent. The content of organic matter is 1 to 2.5 percent. Reaction ranges from moderately acid to neutral.

The Bssg horizon has dry color of 10YR 3/1, 4/1, 4/2, or 5/2. Moist color is 10YR 3/1, 3/2, 4/1, or 4/2. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. The content of organic matter is 0.5 to 1 percent. Reaction is slightly alkaline or moderately alkaline.

The Bk horizon has dry color of 10YR 4/1, 4/2, 5/1, 5/2, or 5/3. Moist color is 10YR 3/1, 3/2, 3/3, 4/2, or 4/3. Texture is clay or clay loam. The content of clay ranges from 35 to 60 percent. The content of organic matter is 0.1 to 0.5 percent. Effervescence ranges from slight to strong. Reaction is moderately alkaline or strongly alkaline.

The 2Bkq horizon has dry color of 10YR 7/3 or 8/3. Moist color is 10YR 4/3 or 5/3. Texture is loam. The content of clay ranges from 18 to 27 percent. The horizon is moderately cemented or strongly cemented with silica and lime. Effervescence is moderate or strong.

The 2Bkqm horizon has dry color of 10YR 4/3, 5/3, 6/3, 7/3, or 8/3. Moist color is 10YR 3/3, 4/3, or 5/3 or 7.5YR 4/4. The horizon is weakly cemented to indurated with silica. Effervescence ranges from slight to violent.

Obskel Series

The Obskel series consists of deep, well drained soils that formed in weathered tephra over residuum and colluvium derived from coarse grained metamorphic rocks, mainly metadiorite. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 15 to 70 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Loamy-skeletal, isotic, mesic Andic Haploxerults

Typical Pedon

Obskel very gravelly sandy loam, on a west-southwest-facing slope of 25 percent, under a cover of mixed conifers, at an elevation of 4,340 feet (1,323 m). When described on 9/29/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); needles and twigs.
Oe—0.5 to 1 inch (1 to 2 cm); partially decomposed needles and twigs.
A—1 to 4 inches (2 to 9 cm); light brown (7.5YR 6/4) very gravelly sandy loam, brown (7.5YR 4/3) moist; 12 percent clay; weak fine granular structure; soft, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine to coarse irregular and tubular pores; 40 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; clear smooth boundary.
Bt1—4 to 9 inches (9 to 22 cm); light brown (7.5YR 6/4) very gravelly sandy loam, brown (7.5YR 4/4) moist; 14 percent clay; weak fine and medium granular structure; soft, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine to coarse irregular and tubular pores; clay bridges between sand grains; 40 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; NaF pH 9.8; clear smooth boundary.
Bt2—9 to 19 inches (22 to 47 cm); reddish yellow (7.5YR 7/6) very gravelly sandy loam, brown (7.5YR 4/4) moist; 17 percent clay; moderate fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine to medium and common coarse roots; many very fine to medium irregular and tubular pores; many faint continuous clay films on faces of peds; 35 percent gravel and 5 percent cobbles; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 9.8; clear smooth boundary.
Bt3—19 to 30 inches (47 to 77 cm); pink (7.5YR 7/4) very gravelly loam, reddish yellow (7.5YR 6/6) moist; 19 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine to medium irregular and tubular pores; many faint continuous clay films on faces of peds; 25 percent gravel and 15 percent cobbles; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 9.5; gradual wavy boundary.
Bt4—30 to 56 inches (77 to 141 cm); yellow (10YR 8/6) very gravelly loam, yellow (10YR 7/8) moist; 18 percent clay; moderate fine and medium subangular blocky structure; soft, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine and fine and common medium irregular and tubular pores; many faint continuous clay films on faces of peds; 30 percent gravel and 10 percent cobbles; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 9.1; abrupt smooth boundary.
Cr—56 inches (141 cm); very weakly cemented metadiorite bedrock; roots occurring more than 4 inches (10 cm) apart; rock fractures occurring less than 4 inches (10 cm) apart.

Type location: Butte County, California; about 1 mile southwest of Inskip,

approximately 2,250 feet south and 600 feet east of the northwest corner of sec. 32, T. 25 N., R. 4 E.; 39 degrees, 58 minutes, 52.9 seconds north latitude and 121 degrees, 33 minutes, 23.5 seconds west longitude; NAD83; USGS Quad: Stirling, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 52 to 54 degrees F (11 to 12 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 12 to 18 percent clay and 35 to 65 percent rock fragments, mostly gravel. Mineralogy is isotic. Rock fragments on the surface range from 15 to 35 percent gravel, 0 to 25 percent cobbles, 0 to 20 percent stones, and 0 to 10 percent boulders. Some pedons have Bw and C horizons.

The A horizon has dry color of 5YR 5/3 or 7.5YR 5/4, 6/3, 6/4, or 7/3. Moist color is 5YR 3/3 or 7.5YR 4/2, 4/3, or 4/4. Texture is very gravelly or gravelly sandy loam. The content of clay ranges from 8 to 16 percent. The horizon has 15 to 40 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. NaF pH is 9.8 to 11.0. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 4/6, 5/6, or 6/6; 7.5YR 6/3, 6/4, 7/4, or 7/6; or 10YR 5/6, 6/4, 6/6, 7/4, 7/6, 7/8, or 8/6. Moist color is 5YR 3/4, 4/4, or 4/6; 7.5YR 3/4, 4/2, 4/3, 4/4, 4/6, 5/4, 5/6, 6/6, or 6/8; or 10YR 4/4, 4/6, 5/4, 5/6, 5/8, or 7/8. Texture is sandy loam, gravelly sandy loam, very gravelly sandy loam, very cobbly sandy loam, very gravelly loam, very cobbly loam, gravelly sandy clay loam, or very gravelly sandy clay loam. The content of clay ranges from 10 to 24 percent. The horizon has 10 to 45 percent gravel, 0 to 20 percent cobbles, and 0 to 10 percent stones. NaF pH is 9.0 to 11.0. Reaction ranges from very strongly acid to slightly acid.

Obstruction Series

The Obstruction series consists of very deep, well drained soils that formed in weathered tephra over residuum and colluvium derived from coarse grained metamorphic rocks, mainly metadiorite. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 75 inches (1,905 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Fine-loamy, isotic, mesic Andic Haploxerults

Typical Pedon

Obstruction gravelly sandy loam, on a west-northwest-facing slope of 45 percent, under a cover of mixed conifers, at an elevation of 4,235 feet (1,291 m). When described on 11/29/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 4 inches (0 to 10 cm); needles, twigs, and a partially decomposed log.

A—4 to 7 inches (10 to 18 cm); light brown (7.5YR 6/4) gravelly sandy loam, brown (7.5YR 4/4) moist; 17 percent clay; strong fine granular structure; soft, very friable, slightly sticky, nonplastic; many very fine and common fine roots; many very fine to medium and common coarse irregular pores; 25 percent subrounded gravel; moderately acid, pH 6.1 by pH meter 1:1 water; NaF pH 10.1; clear smooth boundary.

Bt1—7 to 11 inches (18 to 28 cm); light brown (7.5YR 6/4) gravelly sandy clay loam, brown (7.5YR 4/4) moist; 20 percent clay; moderate medium subangular blocky structure parting to strong fine granular; soft, very friable, slightly sticky, slightly plastic; many very fine and common fine and medium roots; many very fine and

fine tubular and common medium and coarse irregular and tubular pores; many distinct discontinuous clay films on faces of peds and in pores; 25 percent gravel; slightly acid, pH 6.1 by pH meter 1:1 water; NaF pH 10.3; clear smooth boundary.

Bt2—11 to 18 inches (28 to 46 cm); pink (7.5YR 7/4) gravelly fine sandy loam, reddish brown (5YR 4/4) moist; 19 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many very fine and common fine to coarse roots; many very fine and fine irregular and tubular and many medium and common coarse tubular pores; common distinct discontinuous clay films on faces of peds and in pores; 20 percent gravel and 3 percent cobbles; slightly acid, pH 6.1 by pH meter 1:1 water; NaF pH 9.9; clear smooth boundary.

Bt3—18 to 25 inches (46 to 64 cm); reddish yellow (5YR 7/6) gravelly sandy clay loam, yellowish red (5YR 5/6) moist; 23 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium and common coarse tubular pores; many distinct discontinuous clay films on faces of peds and in pores; 10 percent subrounded gravel and 5 percent rounded cobbles; slightly acid, pH 6.1 by pH meter 1:1 water; NaF pH 9.4; clear smooth boundary.

Bt4—25 to 33 inches (64 to 84 cm); pink (5YR 7/4) sandy clay loam, yellowish red (5YR 5/6) moist; 21 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine and fine and common medium tubular pores; many distinct discontinuous clay films on faces of peds and in pores; 10 percent gravel; moderately acid, pH 5.8 by pH meter 1:1 water; NaF pH 9.2; abrupt smooth boundary.

Bt5—33 to 44 inches (84 to 112 cm); reddish yellow (7.5YR 7/6) fine sandy loam, strong brown (7.5YR 5/6) moist; 18 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, nonplastic; many very fine and common fine and medium roots; many very fine and fine and common medium tubular pores; common distinct discontinuous clay films on faces of peds and in pores; 10 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 9.1; abrupt wavy boundary.

Bt6—44 to 64 inches (112 to 163 cm); reddish yellow (7.5YR 8/6) gravelly fine sandy loam, reddish yellow (7.5YR 6/8) moist; 11 percent clay; weak fine and medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; few distinct discontinuous and common faint discontinuous clay films on faces of peds and in pores; 18 percent gravel; strongly acid, pH 5.2 by pH meter 1:1 water; clear irregular boundary.

Bt7—64 to 84 inches (163 to 213 cm); yellow (10YR 8/6) gravelly fine sandy loam, brownish yellow (10YR 6/8) moist; 5 percent clay; weak fine subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common very fine to medium roots; many very fine and common fine and medium tubular pores; few distinct discontinuous and common faint discontinuous clay films on faces of peds and in pores; 20 percent gravel; very strongly acid, pH 5.0 by pH meter 1:1 water; clear irregular boundary.

Cr—84 to 89 inches (213 to 226 cm); moderately cemented metadiorite bedrock; massive; few very fine roots; few very fine tubular pores; cracks occurring more than 4 inches (10 cm) apart.

Type location: Butte County, California; about 1 mile south-southwest of Inskip Cemetery, approximately 1,350 feet north and 1,100 feet west of the southeast corner of sec. 5, T. 24 N., R. 4 E.; 39 degrees, 57 minutes, 43.2 seconds north latitude and 121 degrees, 32 minutes, 37.07 seconds west longitude; NAD27; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 18 to 23 percent clay and 5 to 35 percent rock fragments, mostly gravel. Mineralogy is isotic. Acid oxalate extractable Al plus ½ Fe ranges from 1 to 1.5 to a depth of 10 inches (25 cm). Rock fragments on the surface range from 5 to 35 percent gravel, 0 to 25 percent cobbles, 0 to 20 percent stones, and 0 to 10 percent boulders. Some pedons have hue of 2.5YR in the Bt horizon, and some have Bw and C horizons.

The A horizon has dry color of 5YR 4/3 or 6/4, 7.5YR 5/4 or 6/4, or 10YR 5/3 or 6/6. Moist color is 5YR 3/3 or 4/4; 7.5YR 4/3, 4/4, or 4/6; or 10YR 3/2. Texture is gravelly sandy loam, very gravelly sandy loam, gravelly loam, or very gravelly loam. The content of clay ranges from 10 to 20 percent. The horizon has 15 to 40 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 4 to 8 percent. By sum of cations, base saturation ranges from 25 to 35 percent. By ammonium acetate, CEC ranges from 15 to 20. NaF pH is 9.8 to 11.5. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 5YR 5/6, 6/4, 6/8, 7/4, or 7/6; 7.5YR 5/4, 5/6, 6/4, 6/6, 7/4, or 7/6; or 10YR 6/4, 7/4, or 7/6. Moist color is 5YR 3/4, 4/4, 4/6, or 5/6; 7.5YR 4/4, 4/6, 5/6, or 5/8; or 10YR 4/3, 4/4, 5/6, or 5/8. Texture is sandy loam, gravelly sandy loam, very gravelly sandy loam, sandy clay loam, gravelly fine sandy loam, fine sandy loam, gravelly sandy clay loam, loam, or gravelly loam. The content of clay ranges from 12 to 25 percent. The content of gravel is 5 to 30 percent, and the content of cobbles is 0 to 20 percent. The content of organic matter is 0.5 to 4 percent. By sum of cations, base saturation ranges from 25 to 40 percent. By ammonium acetate, CEC ranges from 8 to 13. NaF pH is 9.0 to 11.0. Reaction ranges from strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 5YR 5/6, 6/8, or 7/6; 7.5YR 4/6, 7/6, 7/8, or 8/6; or 10YR 5/6, 7/6, or 8/6. Moist color is 5YR 4/4 or 5/8, 7.5YR 5/6 or 6/8, or 10YR 4/4, 5/4, 5/6, 5/8, 6/8, or 7/6. Texture is sandy loam, gravelly sandy loam, very gravelly sandy loam, loam, gravelly loam, very gravelly loam, gravelly fine sandy loam, or fine sandy loam. The content of clay ranges from 5 to 20 percent. The content of gravel is 2 to 40 percent. The content of organic matter is 0.1 to 0.5 percent. By sum of cations, base saturation ranges from 5 to 35 percent. By ammonium acetate, CEC ranges from 6 to 11. NaF pH is 9.0 to 10.0. Reaction ranges from very strongly acid to slightly acid.

Olashes Series

The Olashes series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on alluvial fans and fan terraces. Slopes range from 0 to 5 percent. The mean annual precipitation is 17 inches (432 mm), and the mean annual air temperature is 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Mollic Haploxeralfs

Typical Pedon

Olashes sandy loam, on a slope of less than 1 percent, in an irrigated prune orchard, at an elevation of 80 feet (24 m). When described on 9/26/1980, the soil was dry to a depth of 2 inches and moist below that depth. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 4 inches (0 to 10 cm); pale brown (10YR 6/3) sandy loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; few very fine irregular pores; slightly acid, pH 6.2; clear smooth boundary.

Bt1—4 to 14 inches (10 to 36 cm); pale brown (10YR 6/3) sandy clay loam, very dark brown (10YR 2/2) moist; weak medium subangular blocky structure; hard, very friable, sticky, plastic; few very fine roots; many very fine tubular pores; 2 percent gravel; many thin clay films in pores and bridging mineral grains; neutral, pH 6.6; clear wavy boundary.

Bt2—14 to 31 inches (36 to 79 cm); light yellowish brown (10YR 6/4) sandy clay loam, dark brown (10YR 3/3) moist; moderate medium subangular blocky structure; hard, very friable, sticky, plastic; many very fine tubular pores; 5 percent gravel; many moderately thick clay films in pores and common thin clay films on faces of peds; neutral, pH 7.0; clear wavy boundary.

Bt3—31 to 52 inches (79 to 132 cm); light yellowish brown (10YR 6/4) sandy clay loam, dark brown (10YR 3/3) moist; weak medium subangular blocky structure; hard, very friable, slightly sticky, slightly plastic; few very fine tubular pores; 10 percent gravel; many moderately thick clay films in pores and bridging mineral grains; slightly alkaline, pH 7.5; clear smooth boundary.

2C—52 to 62 inches (132 to 157 cm); yellowish brown (10YR 5/4) sand, brown (10YR 4/3) moist; single grain; loose, nonsticky, nonplastic; many very fine irregular pores; 14 percent gravel; slightly alkaline, pH 7.5.

Type location: Sutter County, California; about 10.0 miles southwest of Pennington on West Butte Road, then 420 feet east into a prune orchard, approximately 1,100 feet north and 1,400 feet west of the southeast corner of sec. 18, T. 16 N., R. 1 E.; 39 degrees, 14 minutes, 7 seconds north latitude and 121 degrees, 53 minutes, 47 seconds west longitude; NAD27; USGS Quad: Meridian, California.

Range in Characteristics

The soils are more than 60 inches (152 cm) deep. The mean annual soil temperature ranges from 62 to 66 degrees F (17 to 19 degrees C). The soil temperature is above 47 degrees F (8 degrees C) the entire year. In nonirrigated areas, the soil between depths of 6 and 15 inches (15 and 38 cm) is dry in all parts from June through October and is moist in some or all parts from November through May. The content of gravel is 0 to 15 percent. Depth to the upper boundary of an argillic horizon is 4 to 12 inches (10 to 30 cm). Some pedons do not have a 2C horizon.

The A horizon has dry color of 10YR 6/3 or 6/2. Moist color is 10YR 4/2, 3/2, 3/3, or 2/2. The content of clay ranges from 15 to 20 percent. Reaction is slightly acid or neutral. The content of organic matter is more than 1 percent in the upper 4 inches (10 cm).

The Bt horizon has dry color of 10YR 6/2, 6/3, 6/4, 5/2, or 5/3. Moist color is 10YR 4/2, 4/3, 4/4, 3/3, 3/4, or 2/2 or 7.5YR 4/2 or 3/2. Texture is sandy clay loam, clay loam, or loam. The content of clay ranges from 20 to 35 percent. There is a 4 to 10 percent (absolute) increase in content of clay between the A horizon and the Bt horizon. Reaction is neutral or slightly alkaline.

Ordferry Series

The Ordferry series consists of moderately deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are on basin rims and in flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 18

inches (457 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Xeric Duraquerts

Typical Pedon

Ordferry silty clay, on a slope of 1 percent, under a cover of pasture grasses and dock, at an elevation of 106 feet (32 m). When described on 6/5/1996, the soil was dry to a depth of 29 inches (74 cm). (Colors are for dry soil unless otherwise noted).

A1—0 to 3 inches (0 to 8 cm); light brownish gray (10YR 6/2) silty clay, dark grayish brown (10YR 4/2) moist; 50 percent clay; moderate fine subangular blocky structure parting to moderate fine granular; very hard, firm, moderately sticky, plastic; common very fine and fine roots; few very fine tubular pores; common fine strong brown (7.5YR 4/6) irregular oxidized iron masses and common fine black (N 2/0) irregular manganese masses; 1 percent well rounded gravel; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

A2—3 to 6 inches (8 to 15 cm); light brownish gray (10YR 6/2) silty clay, dark grayish brown (10YR 4/2) moist; 50 percent clay; strong medium prismatic structure parting to moderate fine angular blocky; very hard, very firm, sticky, plastic; common very fine and fine roots; few very fine tubular pores; common fine strong brown (7.5YR 4/6) irregular oxidized iron masses and common fine black (N 2/0) irregular manganese masses; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bss1—6 to 13 inches (15 to 33 cm); light brownish gray (10YR 6/2) silty clay, grayish brown (10YR 5/2) moist; 55 percent clay; strong medium prismatic structure parting to moderate fine angular blocky; very hard, very firm, very sticky, very plastic; common very fine roots; few very fine tubular pores; many fine strong brown (7.5YR 4/6) irregular oxidized iron masses and many fine black (N 2/0) irregular manganese masses; few slickensides; neutral, pH 6.6 by Hellige-Truog; abrupt smooth boundary.

Bss2—13 to 25 inches (33 to 64 cm); light brownish gray (10YR 6/2) silty clay, grayish brown (10YR 5/2) moist; 60 percent clay; weak medium prismatic structure parting to moderate fine angular blocky; very hard, very firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; common fine strong brown (7.5YR 4/6) irregular oxidized iron masses, common fine black (N 2/0) irregular manganese masses, and common fine black (N 2/0) spherical manganese nodules; common slickensides and wedge-shaped aggregates; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

Bk—25 to 29 inches (64 to 74 cm); light yellowish brown (10YR 6/4) silty clay, yellowish brown (10YR 5/4) moist; 45 percent clay; moderate fine subangular blocky structure; hard, firm, sticky, plastic; very few very fine roots; few very fine tubular pores; common fine strong brown (7.5YR 4/6) irregular oxidized iron masses and common fine black (N 2/0) spherical manganese nodules; strongly effervescent on concretions; moderately alkaline, pH 8.3 by Hellige-Truog; abrupt smooth boundary.

2Bkqm1—29 to 33 inches (74 to 84 cm); grayish brown (10YR 5/2), indurated duripan, grayish brown (2.5Y 5/2) moist; silica- and lime-cemented capping 0.25 inch (0.6 cm) thick; strong thin platy structure; very rigid, nonsticky, nonplastic; very few very fine roots between plates and very few very fine roots matted on top of the capping; very few tubular pores; violently effervescent throughout; abrupt smooth boundary.

2Bkqm2—33 to 40 inches (84 to 102 cm); grayish brown (10YR 5/2), strongly cemented to indurated duripan, grayish brown (2.5Y 5/2) moist; strong thin platy structure; very rigid, nonsticky, nonplastic; slightly effervescent throughout.

Type location: Butte County, California; about 5.8 miles southeast of Rancho Llano Seco headquarters, approximately 2,400 feet west and 5,500 feet south of the intersection of Grainland Road and Seven Mile Lane; in an unsectionized area in the Llano Seco Land Grant; 121 degrees, 55 minutes, 0.0 seconds north latitude and 39 degrees, 35 minutes, 37.5 seconds west longitude; NAD83; USGS Quad: Llano Seco, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from May to October 15 (about 165 days). The particle-size control section averages 45 to 55 percent clay. Mineralogy is dominantly smectitic. The soils are calcareous from a depth of 25 to 40 inches (64 to 102 cm). Reversible, surface-initiated cracks 0.5 to 1 inch (1.3 to 2.5 cm) wide extend to a depth of 25 inches (64 cm) from June to October (about 130 days) when the soils are not irrigated. Few or common slickensides occur in the Bss horizon. A fluctuating water table can occur from the top of the duripan to 6 inches (15 cm) below the surface of the soil from December through May. Redoximorphic features, such as manganese nodules, manganese masses, and oxidized iron masses, may occur throughout all horizons. Some pedons have accumulations of carbonate and/or carbonate concretions in chimney areas.

The A horizon has dry color of 10YR 6/2. Moist color is 10YR 4/2. Texture is silty clay or clay. The content of clay ranges from 40 to 50 percent. The content of organic matter is 1 to 2 percent. Reaction is slightly acid or neutral.

The Bss1 horizon has dry color of 10YR 6/2. Moist color is 10YR 5/2, 4/2, 4/3, 3/3, or 3/4. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. The content of organic matter is 0.1 to 1 percent. Reaction is neutral or slightly alkaline.

The Bss2 horizon has dry color of 10YR 6/2 or 6/3. Moist color is 10YR 4/2, 5/2, 4/3, or 3/3. Texture is silty clay or clay. The content of clay ranges from 40 to 60 percent. The content of organic matter is 0.1 to 1 percent. Reaction is slightly alkaline or moderately alkaline.

The Bk horizon has dry color of 10YR 6/2, 6/3, or 6/4. Moist color is 10YR 4/2, 4/3, 5/4, or 5/3. Texture is silty clay or clay loam. The content of clay ranges from 35 to 50 percent. The content of organic matter is 0.1 to 1 percent. Effervescence ranges from violent to slight. Salinity ranges from 0 to 2 mmhos/cm. Reaction is moderately alkaline or strongly alkaline.

The 2Bkqm horizon has dry color of 10YR 6/4 or 5/2. Moist color is 10YR 4/4 or 4/3 or 2.5Y 5/2. Rupture resistance ranges from strongly cemented to indurated with silica and lime.

Oregongulch Series

The Oregongulch series consists of moderately deep, somewhat excessively drained soils that formed in residuum and colluvium derived from trondhjemite. These soils are on ridgetops and side slopes on granitic Sierra Nevada foothills. Slopes range from 2 to 70 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Coarse-loamy, mixed, active, thermic Typic Haploxerepts

Typical Pedon

Oregongulch gravelly sandy loam, on a southeast-facing slope of 28 percent, under a cover of whiteleaf manzanita, live oak, Pacific madrone, toyon, Pacific poison oak,

foothill pine, and scattered ponderosa pine, at an elevation of 1,000 feet (305 m). When described on 9/29/1998, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 4 inches (3 to 10 cm); light gray (10YR 7/2) gravelly sandy loam, dark grayish brown (10YR 4/2) moist; 10 percent clay; weak very fine subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; few very fine roots; many very fine interstitial pores; 30 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bw1—4 to 7 inches (10 to 18 cm); very pale brown (10YR 7/3) gravelly sandy loam, brown (10YR 5/3) moist; 12 percent clay; weak fine subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; few very fine to medium roots; many very fine interstitial pores; 20 percent subangular gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bw2—7 to 13 inches (18 to 33 cm); very pale brown (10YR 7/3) gravelly sandy loam, yellowish brown (10YR 5/4) moist; 15 percent clay; moderate fine subangular blocky structure; slightly hard, firm, nonsticky, nonplastic; common medium and coarse roots; common very fine interstitial pores; 25 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bw3—13 to 18 inches (33 to 46 cm); very pale brown (10YR 7/3) gravelly sandy loam, yellowish brown (10YR 5/4) moist; 15 percent clay; moderate fine subangular blocky structure; slightly hard, firm, nonsticky, nonplastic; common medium roots; common very fine interstitial pores; 30 percent subangular gravel; moderately acid, pH 5.8 by Hellige-Truog; abrupt smooth boundary.

C—18 to 24 inches (46 to 61 cm); very pale brown (10YR 7/3) very gravelly sandy loam, yellowish brown (10YR 5/4) moist; 13 percent clay; moderate medium subangular blocky structure; slightly hard, firm, nonsticky, nonplastic; common medium roots; common very fine interstitial pores; 40 percent subangular gravel; moderately acid, pH 5.8 by Hellige-Truog; abrupt smooth boundary.

Cdt—24 to 60 inches (61 to 152 cm); weathered, densic trondhjemite bedrock; very pale brown (10YR 8/3) very gravelly loamy coarse sand, very pale brown (10YR 7/3) moist; 5 percent clay; massive, hard, firm, noncemented, nonsticky, nonplastic; common medium and coarse roots in cracks; 20 percent discontinuous prominent yellowish red (5YR 5/6 moist) clay films on rocks; after crushing, 50 percent hard subangular gravel; moderately acid, pH 5.8 by Hellige-Truog.

Type location: Butte County, California; about 3.7 miles northwest of Forbestown, approximately 1,900 feet west and 750 feet south of the northeast corner of sec. 6, T. 19 N., R. 6 E.; 39 degrees, 32 minutes, 22 seconds north latitude and 121 degrees, 20 minutes, 21 seconds west longitude; NAD83; USGS Quad: Forbestown, California.

Range in Characteristics

The depth to densic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The particle-size control section averages 12 to 18 percent clay and 20 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. The content of organic matter is 1 to 2.5 percent to a depth of 4 inches (10 cm) and is less than 1 percent from 4 to 24 inches (10 to 61 cm). Rock fragments on the surface range from 5 to 40 percent gravel.

The A horizon has dry color of 10YR 5/2, 6/2, or 7/2. Moist color is 10YR 3/2, 4/2, or 4/3. Texture is gravelly sandy loam, gravelly coarse sandy loam, sandy loam, or coarse sandy loam. The content of clay ranges from 5 to 12 percent. The content of gravel is 0 to 30 percent. Reaction is slightly acid or neutral.

The Bw horizon has dry color of 10YR 6/2, 7/2, 7/3, 8/2, or 8/3. Moist color is 10YR 3/3, 4/3, 5/3, 5/4, 6/4, or 7/3. Texture is gravelly sandy loam, gravelly coarse sandy loam, coarse sandy loam, or loamy coarse sand. The content of clay ranges from 3 to 15 percent. The content of gravel is 10 to 30 percent. Reaction ranges from strongly acid to slightly acid.

The C horizon has dry color of 10YR 7/3, 8/2, or 8/3. Moist color is 10YR 5/4 or 6/2. Texture is very gravelly sandy loam or gravelly loamy coarse sand. The content of clay ranges from 3 to 13 percent. The content of gravel is 20 to 50 percent. Reaction is moderately acid or slightly acid.

The Cdt horizon has variegated dry color of 10YR 6/3, 7/3, 8/2, or 8/3; 7.5YR 6/6; or 5YR 6/6. It has variegated moist color 10YR 5/4, 6/2, 6/4, or 7/3; 7.5YR 5/6; or 5YR 4/6. After crushing, texture is gravelly sandy clay loam, loamy coarse sand, gravelly loamy coarse sand, very gravelly loamy coarse sand, very gravelly coarse sand, or gravelly coarse sand. The content of clay ranges from 1 to 22 percent. The content of gravel is 10 to 50 percent. Reaction ranges from strongly acid to slightly acid.

Oroshore Series

The Oroshore series consists of moderately deep, well drained soils that formed in residuum and colluvium derived from metasedimentary and metavolcanic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 3 to 70 percent. The mean annual precipitation is about 38 inches (965 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, thermic Ultic Haploxeralfs

Typical Pedon

Oroshore gravelly loam, on a south-southwest-facing slope of 17 percent, under a cover of annual grasses and forbs and scattered blue oaks, at an elevation of 750 feet (229 m). When described on 6/6/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); pink (7.5YR 7/4) gravelly loam, brown (7.5YR 5/4) moist; 27 percent clay; moderate coarse subangular blocky structure parting to strong fine granular; slightly hard, very friable, slightly sticky, slightly plastic; common very fine roots; many very fine to medium and common coarse tubular and irregular pores; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 15 inches (5 to 38 cm); pink (7.5YR 8/4) gravelly clay loam, brown (7.5YR 5/4) moist; 30 percent clay; moderate medium and coarse subangular blocky structure; slightly hard, very friable, moderately sticky, moderately plastic; common very fine and fine and few medium roots; many very fine to coarse tubular pores; 70 percent continuous distinct clay films; 10 percent cobbles and 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt2—15 to 28 inches (38 to 71 cm); pink (5YR 8/4) very cobbly clay loam, reddish yellow (5YR 6/6) moist; 33 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, moderately sticky, moderately plastic; common very fine roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 20 percent cobbles and 20 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt3—28 to 34 inches (71 to 86 cm); reddish yellow (5YR 7/6) extremely gravelly clay loam, yellowish red (5YR 5/6) moist; 37 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine and fine tubular pores; 80 percent

continuous prominent clay films; 20 percent cobbles and 50 percent gravel; neutral, pH 6.9 by Hellige-Truog; clear smooth boundary.

Crt—34 inches (86 cm); weakly cemented metavolcanic bedrock; few very fine roots; few very fine and fine tubular pores; 20 percent continuous prominent clay films; slightly alkaline, pH 7.8 by Hellige-Truog.

Type location: Butte County, California; about 0.5 mile southwest of Lime Saddle Boat Ramp, approximately 1,000 feet north and 1,900 feet west of the southeast corner of sec. 18, T. 21 N., R. 4 E.; 39 degrees, 40 minutes, 17 seconds north latitude and 121 degrees, 34 minutes, 4 seconds west longitude; NAD83; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 66 degrees F (15 to 19 degrees C). The particle-size control section averages 27 to 35 percent clay and 35 to 80 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 5 to 30 percent gravel, 0 to 25 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 7.5YR 6/3, 6/4, 7/3, or 7/4 or 10YR 6/4, 7/3, or 7/4. Moist color is 7.5YR 4/2, 4/3, 4/4, or 5/4 or 10YR 4/3. Texture is loam, gravelly loam, or very gravelly loam. The content of clay ranges from 20 to 27 percent. The horizon has 10 to 45 percent gravel and 0 to 10 percent cobbles. Reaction ranges from neutral to moderately acid.

The Bt horizon has dry color of 7.5YR 6/4, 7/4, or 8/4; 5YR 6/4, 7/4, 7/6, or 8/4; or 10YR 6/4, 7/4, or 8/4. Moist color is 7.5YR 4/4, 5/4, 5/6, or 6/6; 5YR 4/4, 4/6, 5/4, 5/6, 6/6, 5/8, or 6/8; or 10YR 4/4, 5/4, 5/6, or 5/8. Texture is gravelly clay loam, very gravelly clay loam, extremely gravelly clay loam, very cobbly clay loam, or extremely cobbly clay loam. The content of clay ranges from 27 to 39 percent. The horizon has 15 to 65 percent gravel, 0 to 40 percent cobbles, and 0 to 20 percent stones. Reaction ranges from neutral to moderately acid.

Oroville Series

The Oroville series consists of moderately deep, poorly drained soils that formed in alluvium derived from metamorphic and igneous rocks. These soils are in swales on intermediate terraces. Slopes range from 0 to 9 percent. The mean annual precipitation is about 24 inches (610 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, active, thermic Aquic Durixeralfs

Typical Pedon

Oroville gravelly fine sandy loam, on a southeast-facing slope of 3 percent, under a cover of annual grasses and forbs, at an elevation of 280 feet (85 m). When described on 9/26/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/4) gravelly fine sandy loam, dark brown (7.5YR 3/3) moist; 18 percent clay; strong thick platy structure parting to moderate fine subangular blocky; slightly hard, friable, nonsticky, nonplastic; many very fine roots; few very fine tubular and common very fine irregular pores; 20 percent well rounded mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

BAt—2 to 6 inches (5 to 15 cm); yellowish red (5YR 4/6) gravelly sandy loam, dark reddish brown (5YR 3/4) moist; 20 percent clay; strong medium platy structure parting to moderate fine subangular blocky; very hard, friable, slightly sticky, slightly plastic; few fine and common very fine roots; few very fine tubular pores; 5 percent discontinuous distinct clay films on vertical faces of peds; 20 percent well rounded mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—6 to 13 inches (15 to 33 cm); red (2.5YR 4/6) gravelly clay loam, dark red (2.5YR 3/6) moist; 28 percent clay; strong medium subangular blocky structure; very hard, firm, slightly sticky, moderately plastic; few fine and common very fine roots; common very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds; 20 percent well rounded mixed gravel; slightly acid, pH 6.3 by Hellige-Truog; abrupt wavy boundary.

2Bt2—13 to 17 inches (33 to 43 cm); reddish brown (2.5YR 4/4) gravelly clay, dark red (2.5YR 3/6) moist; 50 percent clay; strong fine prismatic structure parting to moderate fine angular blocky; extremely hard, very firm, very sticky, very plastic; few very fine roots; many very fine tubular pores; 5 percent slickensides and 50 percent continuous prominent clay films on faces of peds; 20 percent well rounded mixed gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

2Btg—17 to 23 inches (43 to 58 cm); brown (10YR 5/3) gravelly sandy clay, brown (10YR 4/3) moist; 50 percent clay; weak fine angular blocky structure; extremely hard, very firm, very sticky, very plastic; few very fine roots; few very fine tubular pores; 50 percent continuous prominent clay films on faces of peds; 40 percent fine irregular manganese masses; 15 percent fine distinct olive gray (5Y 5/2) iron depletions lining pores; 30 percent well rounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt wavy boundary.

3Bqm1—23 to 31 inches (58 to 79 cm); extremely gravelly, indurated duripan; very rigid, cemented by silica, nonsticky, nonplastic; 2 percent well rounded mixed cobbles and 75 percent well rounded mixed gravel; clear wavy boundary.

3Bqm2—31 to 60 inches (79 to 152 cm); extremely gravelly, strongly cemented duripan; rigid, cemented by silica, nonsticky, nonplastic; 2 percent well rounded mixed cobbles and 75 percent well rounded mixed gravel.

Type location: Butte County, California; about 0.5 mile north of downtown Oroville, in the Fernandez Land Grant, approximately 3,200 feet west and 1,100 feet south of the northeast corner of projected sec. 8, T. 19 N., R. 4 E.; 39 degrees, 31 minutes, 20 seconds north latitude and 121 degrees, 33 minutes, 5 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

Depth to the extremely gravelly, indurated duripan ranges from 20 to 40 inches (51 to 102 cm), and depth to the 2Bt horizon ranges from 6 to 27 inches (15 to 69 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 35 to 50 percent clay and 2 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur from the top of the duripan to the surface of the soil from December through April. Rock fragments on the surface range from 5 to 20 percent gravel.

The A horizon has dry color of 7.5YR 5/3, 5/4, 6/3, 6/4, or 7/3 or 5YR 3/4. Moist color is 7.5YR 3/3, 3/4, 4/3, or 4/4; 5YR 3/4 or 4/4; or 2.5YR 3/4. Texture is gravelly sandy loam, fine sandy loam, sandy loam, or loam. The content of clay ranges from 15 to 24 percent. The content of gravel is 5 to 20 percent. The content of organic matter is 0.5 to 2 percent. Redoximorphic features range from 0 to 10 percent soft oxidized iron masses and 0 to 20 percent iron depletions. Reaction is moderately acid or slightly acid.

The BAt horizon has dry color of 7.5YR 5/4, 6/3, or 6/4 or 5YR 4/4, 4/6, or 5/3. Moist color is 7.5YR 4/3 or 4/4, 5YR 3/4 or 4/4, or 2.5YR 3/4. Texture is gravelly sandy

loam, gravelly fine sandy loam, gravelly loam, loam, or sandy loam. The content of clay ranges from 18 to 25 percent. The content of gravel is 3 to 20 percent. The content of organic matter is 0.2 to 0.8 percent. Redoximorphic features range from 0 to 30 percent soft oxidized iron masses, 0 to 15 percent iron depletions, and 0 to 5 percent soft manganese masses. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 7.5YR 5/4, 6/4, or 7/4; 5YR 5/4 or 5/6; or 2.5YR 4/6. Moist color is 7.5YR 4/3 or 4/4; 5YR 3/4, 4/4, 4/6, or 4/8; or 2.5YR 3/6. Texture is gravelly clay loam, gravelly sandy clay loam, very gravelly sandy clay loam, sandy clay loam, or clay loam. The content of clay ranges from 22 to 35 percent. The content of gravel is 5 to 40 percent. The content of organic matter is 0.1 to 0.5 percent. Redoximorphic features range from 0 to 2 percent soft oxidized iron masses and 0 to 15 percent soft manganese masses. Reaction ranges from moderately acid to neutral.

The 2Bt horizon has dry color of 10YR 5/3 or 5/4; 7.5YR 5/4 or 7/4; 5YR 4/4, 4/6, 5/4, or 5/6; or 2.5YR 4/4. Moist color is 10YR 4/3 or 4/4; 7.5YR 4/3 or 4/4; 5YR 3/3, 3/4, 4/4, or 4/6; or 2.5YR 3/6. Texture is gravelly clay, gravelly sandy clay, sandy clay, or clay. The content of clay ranges from 45 to 52 percent. The horizon has 5 to 45 percent gravel and 0 to 2 percent cobbles. The content of organic matter is 0 to 0.3 percent. Redoximorphic features range from 0 to 20 percent iron depletions and 0 to 40 percent soft manganese masses. Reaction ranges from moderately acid to neutral.

The 2Btg horizon has dry color of 10YR 5/3 or 5/4; 5YR 4/4, 4/6, 5/6, or 6/4; or 7.5YR 5/4 or 7/4. Moist color is 10YR 4/3 or 4/4; 5YR 3/3, 4/4, 4/6, or 5/4; or 7.5YR 4/4. Texture is gravelly sandy clay, gravelly clay, sandy clay, or clay. The content of clay ranges from 45 to 55 percent. The content of organic matter is 0 to 0.3 percent. Redoximorphic features include iron depletions and manganese masses. Reaction is slightly acid or neutral.

The 3Bq horizon, where it occurs, has dry color of 7.5YR 6/4 or 6/6. Moist color is 7.5YR 4/4, 4/6, 5/4, or 5/6. Texture is very gravelly sandy loam, sandy clay loam, or sandy loam. The content of clay ranges from 12 to 28 percent. The content of gravel is 0 to 40 percent. Redoximorphic features range from 0 to 20 percent soft manganese masses. Reaction is slightly acid or neutral.

The 3Bqm horizon is indurated to moderately cemented with silica. A silica and manganese capping $^{1}/_{16}$ to $^{3}/_{8}$ inch thick occurs in some pedons. Manganese coatings occur on top of the duripan. The horizon has 15 to 80 percent well rounded gravel and 0 to 5 percent cobbles.

Oxyaquic Xerofluvents

Oxyaquic Xerofluvents consist of very deep, somewhat poorly drained soils that formed in alluvium derived from placer mining outwash from the Cherokee Gold Mine. These soils are on flood plains within levees, on basin floors, and in sediment basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Mixed, superactive, nonacid, thermic Oxyaquic Xerofluvents

Reference Pedon

Oxyaquic Xerofluvents, thermic, on a slope of 0 percent, under a cover of rice, at an elevation of 120 feet (37 m). When described on 5/21/1992, the soil was moist below a depth of 4 inches (10 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 6 inches (0 to 15 cm); light gray (N 7/0) very fine sandy loam, dark gray (10YR 4/1) moist; 18 percent clay; massive; hard, friable, slightly sticky, moderately plastic; common very fine roots; few very fine tubular pores; many

medium strong brown (7.5YR 4/6) oxidized iron masses, yellowish red (5YR 4/6) moist; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

C1—6 to 20 inches (15 to 51 cm); pinkish gray (7.5YR 7/2) silt loam, gray (5YR 5/1) moist; 25 percent clay; massive; hard, friable, slightly sticky, moderately plastic; common very fine roots; few very fine tubular pores; many medium reddish yellow (7.5YR 7/6) oxidized iron masses, dark gray (5YR 4/1) moist; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

C2—20 to 30 inches (51 to 76 cm); yellow (10YR 7/6) silt loam, strong brown (7.5YR 7/4) moist; 25 percent clay; strong thin platy structure; hard, friable, slightly sticky, moderately plastic; few very fine roots; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

C3—30 to 43 inches (76 to 109 cm); pink (7.5YR 7/6), stratified silt loam to loamy fine sand, strong brown (7.5YR 5/6) moist; 10 percent clay; massive parting to strong thin platy structure; hard, friable, slightly sticky, slightly plastic; many medium reddish yellow (7.5YR 6/8) oxidized iron masses and common fine black (N 2/0) manganese masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

C4—43 to 55 inches (109 to 140 cm); reddish yellow (7.5YR 7/6) silt loam, yellowish brown (10YR 5/8) moist; 20 percent clay; strong thin platy structure; hard, friable, moderately sticky, moderately plastic; common fine black (N 2/0) manganese masses and many medium strong brown (7.5YR 5/6) oxidized iron masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

C5—55 to 72 inches (140 to 183 cm); very pale brown (10YR 8/3), stratified loamy fine sand to silt loam, brownish yellow (10YR 6/6) moist; 20 percent clay; massive parting to strong thick platy structure; slightly hard, very friable, slightly sticky, slightly plastic; many medium yellowish red (5YR 5/8) and strong brown (7.5YR 5/6) oxidized iron masses and common fine black (N 2/0) manganese masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

2Ab—72 to 74 inches (183 to 188 cm); grayish brown (10YR 5/2) clay, very dark gray (10YR 3/1) moist; 50 percent clay; moderate medium granular structure; very hard, firm, very sticky, very plastic; slightly alkaline, pH 7.5 by Hellige-Truog.

The reference pedon is an example of the soils within this category. The properties represented in map units 338, 339, 439, 440, and 441 vary. The particle-size classes represented by this description include coarse-loamy, fine-loamy, and fine.

Type location: Butte County, California; about 2.5 miles northeast of Richvale, approximately 2,000 feet south and 100 feet east of the center of sec. 2, T. 19 N., R. 2 E.; 39 degrees, 31 minutes, 30 seconds north latitude and 121 degrees, 42 minutes, 55 seconds west longitude; NAD27; USGS Quad: Shippee, California.

Range in Characteristics

Depth to a buried horizon of clay ranges from 24 to 72 inches (61 to 183 cm) or more. The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about June to October (about 125 days). The particle-size control section is coarse-loamy, fine-loamy, fine, or coarse-loamy over clayey. Mineralogy is mixed. A fluctuating water table can occur at a depth of 18 to 72 inches (46 to 183 cm) from December through April. Redoximorphic features, such as oxidized iron masses and manganese masses, can occur in all horizons. Some pedons have a duripan, which is at a depth of 38 to 60 inches (96 to 152 cm) or more.

The Ap horizon has dry color of N 7/0 or 10YR 5/2, 5/3, 5/4, 6/3, 6/4, 7/2, 7/3, or 7/4. Moist color is 10YR 3/1, 3/2, 3/3, 4/1, 4/2, 4/3, 5/2, 5/3, 5/4, or 6/3; 2.5Y 4/2, 4/3, or 5/2; or 5Y 4/1. Texture typically is very fine sandy loam or silt loam, but the range includes sand, loamy sand, sandy loam, silty clay loam, clay loam, clay, and silty clay.

The content of clay ranges from 5 to 60 percent. Reaction ranges from moderately acid to moderately alkaline.

The C horizon has dry color of 2.5Y 6/6 or 7/3; 10YR 4/3, 5/3, 5/4, 6/2, 6/4, 7/2, 7/3, 7/6, 8/2, 8/3, 8/4, or 8/6; or 7.5YR 5/4, 5/6, 6/6, 7/2, 7/4, 7/6, or 7/8. Moist color is 5Y 4/1 or 6/1; 2.5Y 4/2, 5/2, or 5/6; 10YR 3/2, 3/3, 4/1, 4/2, 4/3, 5/3, 5/6, 5/8, 6/4, 6/6, or 7/4; or 7.5YR 4/4, 5/4, 5/6, 5/8, 6/4, or 6/6. Texture is loamy fine sand, silt loam, fine sand, loamy sand, sand, fine sandy loam, loam, silty clay loam, silty clay, or clay or is stratified very fine sandy loam to silt loam, loam to silty clay loam, or silt loam to fine sand. The content of clay ranges from 5 to 60 percent. The content of gravel is 0 to 25 percent. Reaction ranges from neutral to moderately alkaline.

The 2Ab or Bssb horizon has dry color of 10YR 4/1, 5/2, or 6/2. Moist color is 10YR 3/1 or 4/1, N 2/0, or 5Y 4/1. Texture is clay or silty clay. The content of clay ranges from 40 to 80 percent. Effervescence ranges from slight to violent. Reaction is slightly alkaline or moderately alkaline.

Palexerults

Palexerults consist of very deep, well drained soils that formed in colluvium over residuum derived from volcanic rocks over Eocene sediments. These soils are on side slopes on Sierra Nevada foothills. Slopes range from 2 to 50 percent. The mean annual precipitation is about 29 inches (737 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Kaolinitic, superactive, thermic Typic Palexerults

Typical Pedon

Palexerults gravelly loam, on a north-facing slope of 20 percent, under a cover of blue oak, interior live oak, manzanita, toyon, poison oak, and annual grasses and forbs, at an elevation of 760 feet (232 m). When described on 5/21/2001, the soil was dry to a depth of 12 inches (31 cm) and slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); pale brown (10YR 6/3) gravelly loam, very dark grayish brown (10YR 3/2) moist; 20 percent clay; moderate fine and medium subangular blocky structure; very hard, firm, moderately sticky, slightly plastic; many fine and medium roots throughout; many fine irregular pores; 5 percent rounded mixed cobbles and 10 percent rounded mixed gravel; neutral, pH 7.0 by Hellige-Truog; clear wavy boundary.

Bt1—2 to 12 inches (5 to 31 cm); pale brown (10YR 6/3) gravelly loam, brown (10YR 4/3) moist; 26 percent clay; moderate medium subangular blocky structure; very hard, firm, moderately sticky, moderately plastic; many fine and medium roots between peds; common fine and medium tubular pores; 35 discontinuous distinct clay films on faces of peds; 5 percent rounded mixed cobbles and 25 percent rounded mixed gravel; slightly acid, pH by Hellige-Truog; abrupt wavy boundary.

Bt2—12 to 20 inches (31 to 51 cm); 60 percent reddish yellow (7.5YR 6/6), 30 percent light brown (7.5YR 6/3), and 10 percent pink (7.5YR 7/4) clay loam, 60 percent brown (7.5 4/4), 30 percent brown (10YR 5/3), and 10 percent yellowish brown (10YR 5/6) moist; 34 percent clay; moderate medium angular blocky structure; very hard, very firm, moderately sticky, moderately plastic; common fine to coarse roots between peds; common fine tubular pores; 55 percent discontinuous distinct clay films on faces of peds; 10 percent well rounded quartz gravel; very strongly acid, pH 4.8 by Hellige-Truog; clear smooth boundary.

2Bt3—20 to 29 inches (51 to 74 cm); 65 percent reddish yellow (5YR 6/6) and 35 percent pink (7.5YR 8/4) silty clay, 65 percent reddish brown (5YR 4/4) and 35 percent strong brown (7.5YR 5/6) moist; 50 percent clay; moderate medium

angular blocky structure; very hard, very firm, moderately sticky, very plastic; common fine and medium roots between peds and few coarse roots in cracks; common fine vesicular pores; 70 percent discontinuous distinct clay films on faces of peds; 5 percent well rounded quartz gravel; very strongly acid, pH 4.5 by Hellige-Truog; clear wavy boundary.

2BCt—29 to 46 inches (74 to 117 cm); 70 percent reddish yellow (5YR 6/6) and 30 percent pink (7.5YR 8/4) silty clay, 70 percent reddish brown (5YR 4/4) and 30 percent brown (7.5YR 5/4) moist; 55 percent clay; moderate medium and coarse angular blocky structure; very hard, very firm, moderately sticky, very plastic; many fine and medium and few coarse roots in cracks; common fine vesicular pores; 75 percent continuous distinct clay films on faces of peds; 3 percent well rounded quartz gravel; very strongly acid, pH 4.5 by Hellige-Truog; clear smooth boundary.

2C—46 to 65 inches (117 to 165 cm); 70 percent reddish yellow (5YR 6/6) and 30 percent reddish yellow (7.5YR 7/6) silty clay, 70 percent reddish brown (5YR 4/4) and 30 percent light brown (7.5YR 6/4) moist; 50 percent clay; moderate medium angular blocky structure; very hard, very firm, moderately sticky, very plastic; few fine and coarse roots in cracks; few fine vesicular pores; 2 percent well rounded quartz gravel; extremely acid, pH 4.3 by Hellige-Truog; clear wavy boundary.

2Cd—65 inches (165 cm); densic claystone; noncemented.

Type location: Butte County, California; about 3.4 miles north of Oroville, approximately 1,550 feet east and 1,150 feet south of the northwest corner of sec. 29, T. 20 N., R. 4 E.; 39 degrees, 33 minutes, 56 seconds north latitude and 121 degrees, 33 minutes 8 seconds west longitude; NAD27; USGS Quad: Oroville, California.

Range in Characteristics

The depth to densic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 26 to 40 percent clay and 3 to 25 percent rock fragments, mostly gravel. Mineralogy is kaolinitic. Rock fragments on the surface range from 0 to 20 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones, and 0 to 3 percent boulders. Mixed colors are common and are inherited from the parent material.

The A horizon has dry color of 10YR 4/2, 4/3, 5/2, 5/3, or 6/3 or 7.5YR 4/3 or 6/3. Moist color is 10YR 3/2, 3/3, or 4/3 or 7.5YR 3/3 or 5/4. Texture is loam, gravelly loam, or silt loam. The content of clay ranges from 16 to 24 percent. The horizon has 0 to 20 percent gravel and 0 to 10 percent cobbles. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 10YR 4/3, 4/4, 6/3, or 6/4 or 7.5YR 6/3, 5/4, 6/6, or 7/4. Moist color is 10YR 3/4, 4/3, 5/3, 5/4, or 5/6; 7.5YR 4/3, 4/4, or 5/6; or 5YR 4/4. Texture is loam, gravelly loam, silt loam, silty clay loam, sandy clay loam, gravelly sandy clay loam, clay loam, or gravelly clay loam. The content of clay ranges from 20 to 35 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. Reaction ranges from very strongly acid to slightly acid.

The 2Bt horizon has dry color of 10YR 5/3 or 6/4; 7.5YR 4/3, 5/4, 6/6, 7/6, or 8/4; or 5YR 6/6. Moist color is 10YR 4/4 or 5/4; 7.5YR 4/4, 5/3, 5/4, 4/6, 5/6, or 6/6; or 5YR 3/4, 4/4, or 5/4. Texture is clay, gravelly clay, silty clay loam, silty clay, or gravelly silty clay. The content of clay ranges from 35 to 60 percent. The content of gravel is 0 to 30 percent. Reaction ranges from extremely acid to strongly acid.

The 2BCt horizon has dry color of 10YR 5/4, 5/6, or 6/4; 7.5YR 8/4; or 5YR 6/6. Moist color is 10YR 5/4, 6/4, or 6/6; 7.5YR 5/3; or 5YR 4/4 or 5/4. Texture is clay, silty clay, gravelly silty clay, clay loam, or sandy clay loam. The content of clay ranges from 30 to 60 percent. The content of gravel is 0 to 30 percent. Reaction ranges from extremely acid to strongly acid.

The 2C horizon has dry color of 10YR 7/2, 7.5YR 5/4 or 7/6, 5YR 6/6, or 2.5Y 6/4. Moist color is 10YR 6/2, 6/4, or 5/6; 7.5YR 4/4 or 5/6; 5YR 4/4 or 6/4; or 2.5Y 6/3. Texture is clay or silty clay. The content of clay ranges from 40 to 60 percent. The content of gravel is 0 to 5 percent. Reaction ranges from extremely acid to strongly acid.

Paradiso Series

The Paradiso series consists of very deep, well drained soils that formed in weathered tephra over residuum derived from volcanic rocks. These soils are on the top of volcanic ridges in the Cascade Mountains. Slopes range from 2 to 30 percent. The mean annual precipitation is about 55 inches (1,397 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Fine, mixed, semiactive, mesic Andic Haploxeralfs

Typical Pedon

Paradiso loam, on a south-facing slope of 5 percent, under a cover of ponderosa pine and black oak, at an elevation of 2,125 feet (648 m). When described on 7/1/1996, the soil was very slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); needles, leaves, and twigs.

A—2 to 4 inches (5 to 10 cm); brown (7.5YR 4/4) loam, dark reddish brown (5YR 3/3) moist; 25 percent clay; strong fine and medium granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine to medium irregular and tubular pores; noneffervescent; 5 percent gravel; slightly acid, pH 5.8 by pH meter 1:1 water; NaF pH 10.0; clear smooth boundary.

ABt—4 to 9 inches (10 to 23 cm); reddish brown (5YR 5/4) clay loam, reddish brown (5YR 4/3) moist; 33 percent clay; strong fine and medium granular structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine and fine and common medium roots; many very fine to medium tubular pores; common distinct continuous clay films on faces of peds and in pores and common distinct discontinuous clay bridges between sand grains; noneffervescent; 5 percent gravel; slightly acid, pH 5.9 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bt1—9 to 16 inches (23 to 41 cm); reddish brown (2.5YR 5/4) clay loam, dark reddish brown (2.5YR 3/4) moist; 36 percent clay; weak medium subangular blocky structure parting to moderate fine granular; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium roots; many very fine to medium tubular pores; common distinct continuous clay films on faces of peds and in pores; noneffervescent; 5 percent gravel; slightly acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.5; gradual smooth boundary.

Bt2—16 to 25 inches (41 to 64 cm); reddish brown (2.5YR 5/4) clay loam, dark reddish brown (2.5YR 3/4) moist; 39 percent clay; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium roots; many very fine to medium tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 3 percent gravel; slightly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.5; gradual smooth boundary.

Bt3—25 to 45 inches (64 to 114 cm); reddish yellow (5YR 6/6) clay, reddish brown (5YR 4/4) moist; 50 percent clay; strong medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 2 percent gravel;

slightly acid, pH 6.2 by pH meter 1:1 water; NaF pH 10.3; gradual smooth boundary.

Bt4—45 to 58 inches (114 to 147 cm); reddish yellow (7.5YR 6/6) clay loam, reddish brown (5YR 4/4) moist; 33 percent clay; strong fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine roots; common very fine and fine tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 1 percent gravel; slightly acid, pH 6.5 by pH meter 1:1 water; NaF pH 10.5; gradual smooth boundary.

Bt5—58 to 74 inches (147 to 188 cm); light brown (7.5YR 6/4) clay loam, brown (7.5YR 4/4) moist; 28 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and few fine tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 1 percent gravel; moderately acid, pH 6.6 by pH meter 1:1 water; NaF pH 10.5; gradual smooth boundary.

2Bt6—74 to 84 inches (188 to 213 cm); light yellowish brown (10YR 6/4) loam, strong brown (7.5YR 4/6) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and few fine tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 5 percent gravel; slightly acid, pH 6.5 by pH meter 1:1 water.

Type location: Butte County, California; about 0.6 mile north of the intersection of Clark Road and Wagstaff Road, approximately 300 feet north and 2,000 feet east of the southwest corner of sec. 1, T. 22 N., R. 3 E.; 39 degrees, 47 minutes, 13.6 seconds north latitude and 121 degrees, 35 minutes, 24.2 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 55 to 59 degrees F (13 to 15 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 35 to 50 percent clay and 0 to 15 percent rock fragments, mostly gravel. Mineralogy is mixed. Acid oxalate extractable Al plus ½ Fe is 1 or more to a depth of 7 inches (18 cm) below the mineral surface. Rock fragments on the surface range from 0 to 15 percent gravel, 0 to 5 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. Some pedons have clay textures in the lower part of the Bt horizon.

The A horizon has dry color of 7.5YR 4/4 or 5/4 or 5YR 5/4 or 6/4. Moist color is 5YR 3/3 or 4/3. Texture is loam. The content of clay ranges from 17 to 27 percent. The content of gravel is 0 to 15 percent. By sum of cations, base saturation ranges from 30 to 40 percent. NaF pH is 9.3 to 10.5. Reaction ranges from moderately acid to neutral.

The ABt horizon has dry color of 5YR 5/4, 5/6, or 6/4. Moist color is 5YR 3/3 or 4/3 or 2.5YR 3/4. Texture is loam or clay loam. The content of clay ranges from 24 to 35 percent. The content of gravel is 0 to 5 percent. By sum of cations, base saturation ranges from 25 to 40 percent. NaF pH is 9.8 to 10.5. Reaction ranges from moderately acid to neutral.

The upper part of the Bt horizon has dry color of 5YR 5/4, 6/4, 5/6, or 6/6 or 2.5YR 5/4 or 6/6. Moist color is 2.5YR 3/4 or 4/6 or 5YR 4/4. Texture is loam, clay loam, or silty clay loam. The content of clay ranges from 25 to 40 percent. The content of gravel is 0 to 5 percent. By sum of cations, base saturation ranges from 25 to 40 percent. NaF pH is 9.5 to 10.5. Reaction ranges from moderately acid to neutral.

The middle part of the Bt horizon has dry color of 5YR 5/6 or 6/6 or 2.5YR 5/4. Moist color is 2.5YR 3/4, 4/4, or 4/6 or 5YR 4/4. Texture is clay loam, silty clay loam, clay, or silty clay. The content of clay ranges from 35 to 55 percent. The content of gravel is 0 to 5 percent. By sum of cations, base saturation ranges from 25 to 45 percent. NaF pH is 9.5 to 10.5. Reaction ranges from strongly acid to neutral.

The lower part of the Bt horizon has dry color of 7.5YR 5/4, 6/4, or 6/6 or 5YR 5/4, 5/6, or 6/6. Moist color is 5YR 4/4 or 4/6 or 7.5YR 4/4. Texture is loam, gravelly loam, or clay loam. The content of clay ranges from 17 to 35 percent. The content of gravel is 0 to 25 percent, and the content of cobbles is 0 to 10 percent. By sum of cations, base saturation ranges from 35 to 50 percent. NaF pH is 9.2 to 10.5. Reaction ranges from very strongly acid to neutral.

The 2Bt horizon has dry color of 10YR 6/4, 6/6, or 7/6 or 7.5YR 6/4. Moist color is 7.5YR 4/4, 4/6, or 5/6 or 10YR 4/4 or 5/6. Texture is loam or gravelly loam. The content of clay ranges from 17 to 27 percent. The content of gravel is 0 to 35 percent, and the content of cobbles is 0 to 15 percent. By sum of cations, base saturation ranges from 35 to 50 percent. NaF pH is 9.2 to 10.5. Reaction ranges from very strongly acid to slightly acid.

Parkshill Series

The Parkshill series consists of very deep, well drained soils that formed in residuum and colluvium derived from mixed intrusive igneous rocks, mainly quartz diorite and gabbro. These soils are on side slopes on plutons on Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Ultic Palexeralfs

Typical Pedon

Parkshill coarse sandy loam, on an east-facing slope of 8 percent, under a cover of annual grasses, forbs, interior live oak, blue oak, and Pacific poison oak, at an elevation of 900 feet (274 m). When described on 8/20/2000, the soil was slightly moist from 0 to 26 inches (0 to 66 cm) and moist from 26 to 61 inches (66 cm to 155 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 2 inches (0 to 5 cm); brown (10YR 5/3) coarse sandy loam, dark brown (7.5YR 3/4) moist; 14 percent clay; moderate very fine and fine granular structure; soft, very friable, nonsticky, nonplastic; many very fine roots; many very fine and fine tubular pores; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

A2—2 to 8 inches (5 to 20 cm); brown (10YR 5/3) coarse sandy loam, dark brown (7.5YR 3/4) moist; 15 percent clay; moderate very fine and fine granular structure; soft, very friable, nonsticky, nonplastic; many very fine roots; many very fine and fine tubular pores; 3 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bw—8 to 18 inches (20 to 46 cm); yellowish brown (10YR 5/4) coarse sandy loam, dark brown (7.5YR 3/4) moist; 17 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine, few medium, and many very fine roots; many very fine and fine tubular pores; 3 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—18 to 26 inches (46 to 66 cm); brown (7.5YR 5/3) coarse sandy loam, dark brown (7.5YR 3/3) moist; 19 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; common fine and many very fine roots; many very fine and fine tubular pores; 30 percent patchy

faint clay films on faces of peds; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bt2—26 to 35 inches (66 to 89 cm); strong brown (7.5YR 5/6) sandy clay loam, strong brown (7.5YR 4/6) moist; 23 percent clay; strong fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few fine and many very fine roots; many very fine and fine and few medium tubular pores; 50 percent patchy distinct clay films on faces of peds; moderately acid, pH 6.1 by Hellige-Truog; clear wavy boundary.

Bt3—35 to 53 inches (89 to 135 cm); strong brown (7.5YR 5/6) sandy clay loam, strong brown (7.5YR 4/6) moist; 25 percent clay; strong fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common fine and very fine roots; many very fine and fine tubular pores; 60 percent patchy distinct clay films on faces of peds; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

BCt—53 to 61 inches (135 to 155 cm); reddish yellow (7.5YR 6/6) sandy clay loam, strong brown (7.5YR 4/6) moist; 23 percent clay; weak very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine and fine tubular pores; 40 percent faint clay films on faces of peds; moderately acid, pH 5.9 by Hellige-Truog.

Type location: Butte County, California; about 4.1 miles northeast of Bangor, approximately 50 feet south and 2,250 feet east of the northwest corner of sec. 24, T. 18 N., R. 5 E.; 39 degrees, 24 minutes, 32 seconds north latitude and 121 degrees, 21 minutes, 46 seconds west longitude; NAD83; USGS Quad: Rackerby, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 59 to 63 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about June through October (about 165 days). The particle-size control section averages 18 to 25 percent clay and 3 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. Some pedons have a BA horizon and/or a BC horizon.

The A horizon has dry color of 10YR 4/3, 4/4, 5/3, 5/4, or 5/6 or 7.5YR 5/3. Moist color is 10YR 3/3 or 3/4, 7.5YR 3/3 or 3/4, or 5YR 3/3. Texture is coarse sandy loam, sandy loam, or loam. The content of clay ranges from 12 to 17 percent. The content of gravel is 0 to 5 percent. The content of organic matter is 2 to 8 percent. By sum of cations, base saturation ranges from 50 to 70 percent. Reaction ranges from moderately acid to neutral.

The Bw horizon has dry color of 10YR 5/4 or 7.5YR 5/3 or 5/4. Moist color is 7.5YR 3/3, 3/4, or 4/4. Texture is coarse sandy loam or sandy loam. The content of clay ranges from 16 to 19 percent. The content of gravel is 0 to 5 percent. The content of organic matter is 0.2 to 1.0 percent. By sum of cations, base saturation ranges from 40 to 55 percent. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 10YR 5/4; 7.5YR 4/6, 5/3, 5/4, or 5/6; or 5YR 5/4. Moist color is 7.5YR 3/3, 3/4, 4/4, or 4/6 or 5YR 3/4 or 4/4. Texture is coarse sandy loam, sandy loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 18 to 23 percent. The content of gravel is 0 to 15 percent. The content of organic matter is 0 to 0.2 percent. By sum of cations, base saturation ranges from 55 to 74 percent. Reaction ranges from moderately acid to neutral.

The lower part of the Bt horizon has dry color of 7.5YR 5/4, 5/6, or 5/8 or 5YR 5/4. Moist color is 7.5YR 4/4 or 4/6 or 5YR 4/4 or 4/6. Texture is sandy loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 18 to 33 percent. The content of gravel is 0 to 25 percent. The content of organic matter is 0 to 0.2 percent. By sum of cations, base saturation ranges from 75 to 85 percent. Reaction ranges from moderately acid to neutral.

The BCt horizon has dry color of 10YR 6/4 or 6/6, 7.5YR 5/6 or 6/6, or 5YR 5/6. Moist color is 10YR 5/6; 7.5YR 4/6, 5/4, or 5/6; or 5YR 4/6. Texture is sandy loam, gravelly sandy loam, or sandy clay loam. The content of clay ranges from 16 to 26 percent. The content of gravel is 0 to 25 percent. The content of organic matter is 0 to 0.2 percent. Reaction ranges from moderately acid to neutral.

The C horizon, where it occurs, has dry color of 10YR 6/4, 6/6, or 7/3 or 7.5YR 6/6. Moist color is 10YR 5/3 or 5/4 or 7.5YR 4/6. Texture is sandy loam or fine sandy loam. The content of clay ranges from 12 to 18 percent. The content of gravel is 0 to 10 percent. Reaction ranges from moderately acid to neutral.

Parrott Series

The Parrott series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on bars on flood plains. Slopes range from 0 to 2 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 63 degrees F (17 degrees C).

Taxonomic class: Fine-silty, mixed, superactive, thermic Fluventic Haploxerepts

Typical Pedon

Parrott silt loam, on a slope of 1 percent, under a cover of walnut trees, at an elevation of 151 feet (46 m). When described on 10/26/1988, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A1—0 to 2 inches (0 to 4 cm); light brownish gray (2.5Y 6/2) silt loam, very dark grayish brown (2.5Y 3/2) moist; 22 percent clay; moderate thin platy structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine tubular pores; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

A2—2 to 8 inches (4 to 20 cm); grayish brown (10YR 5/2) silt loam, very dark grayish brown (10YR 3/2) moist; 23 percent clay; moderate thin and medium platy structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine irregular and tubular pores; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bw1—8 to 20 inches (20 to 52 cm); light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; 21 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine irregular and tubular pores; 8 percent silt coatings on surfaces along pores; 1 percent medium dark grayish brown (10YR 4/2) manganese masses and 25 percent medium brown (7.5YR 5/4) oxidized iron masses; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bw2—20 to 37 inches (52 to 95 cm); light brownish gray (10YR 6/2) silt loam, dark brown (10YR 3/3) moist; 21 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few very fine roots; common fine and many very fine tubular pores; 8 percent silt coatings on surfaces along pores; 10 percent medium brown (7.5YR 4/3) oxidized iron masses; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bw3—37 to 49 inches (95 to 125 cm); brown (10YR 5/3) silt loam, dark brown (10YR 3/3) moist; 21 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few very fine and fine roots; few fine and many very fine tubular pores; 8 percent light brownish gray (10YR 6/2) silt coatings on surfaces along pores; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bw4—49 to 63 inches (125 to 160 cm); pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; 19 percent clay; weak fine subangular blocky structure; slightly hard,

very friable, slightly sticky, moderately plastic; few fine roots; few fine and many very fine tubular pores; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

C—63 to 89 inches (160 to 225 cm); yellowish brown (10YR 5/4) silt loam, dark yellowish brown (10YR 3/4) moist; 17 percent clay; massive; slightly hard, very friable, slightly sticky, moderately plastic; few fine roots; few fine and many very fine tubular pores; neutral, pH 7.2 Hellige-Truog.

Type location: Butte County, California; about 3.8 miles northeast of Nord, approximately 2,200 feet north and 1,700 feet east of the intersection of T. 22 N. and 23 N. and R. 1 W. and 2 W.; 39 degrees, 48 minutes, 13 seconds north latitude and 122 degrees, 1 minute, 23 seconds west longitude; NAD27; USGS Quad: Foster Island, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm). The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 18 to 27 percent clay. Mineralogy is mixed. The content of organic matter decreases regularly with increasing depth. It ranges from 1 to 5 percent to a depth of 49 inches (124 cm) and is less than 1 percent from 49 to 89 inches (124 to 226 cm). By ammonium acetate, base saturation is 100 percent throughout the profile. A fluctuating water table can occur at a depth of 60 inches (152 cm) or more from December through March. Redoximorphic features, such as iron masses and manganese masses, occur in the Ap and A horizons. Some pedons have a gravelly substratum below a depth of 40 inches (102 cm) and/or have disseminated lime at a depth of 45 to 72 inches (114 to 183 cm).

The A horizon has dry color of 2.5Y 6/2 or 10YR 5/2, 5/3, or 6/3. Moist color is 2.5Y 3/2 or 10YR 3/2, 3/3, 4/2, or 4/3. Texture is silt loam. The content of clay ranges from 18 to 27 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bw horizon has dry color of 10YR 5/3, 5/4, or 6/3. Moist color is 10YR 3/3, 3/4, or 4/3. Texture is silt loam. The content of clay ranges from 18 to 27 percent. Reaction is neutral or slightly alkaline.

The C horizon has dry color of 10YR 5/3, 5/4, or 6/3. Moist color is 10YR 3/3, 3/4, or 4/3. Texture is silt loam, loam, fine sandy loam, sandy loam, clay loam, or silty clay loam. The content of clay ranges from 12 to 30 percent. The content of gravel is 0 to 5 percent. Reaction is neutral or slightly alkaline.

Perkins Series

The Perkins series consists of very deep, well drained soils that formed in alluvium derived from igneous and metamorphic rocks. These soils are on low terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Mollic Haploxeralfs

Typical Pedon

Perkins gravelly loam, on a slope of 2 percent, under a cover of yellow starthistle and annual grasses, at an elevation of 135 feet (41 m). When described on 6/8/1994, the soil was dry to a depth of 24 inches (61 cm) and moist from 24 to 73 inches (61 to 185 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 8 inches (0 to 20 cm); strong brown (7.5YR 4/6) gravelly loam, dark brown (7.5YR 3/4) moist; 13 percent clay; strong fine angular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and coarse roots;

many very fine irregular pores; 25 percent mixed gravel; neutral, pH 7.3 by pH meter 1:1 water; clear smooth boundary.

Bt1—8 to 24 inches (20 to 61 cm); yellowish red (5YR 4/6) gravelly loam, dark reddish brown (5YR 3/4) moist; 22 percent clay; strong fine angular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine irregular pores; 60 percent clay films on faces of peds; 25 percent mixed gravel; neutral, pH 7.1 by pH meter 1:1 water; abrupt smooth boundary.

Bt2—24 to 38 inches (61 to 97 cm); yellowish red (5YR 5/6) very gravelly sandy clay loam, dark reddish brown (5YR 3/4) moist; 17 percent clay; strong fine angular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine irregular pores; 60 percent clay films on faces of peds; 40 percent mixed gravel; neutral, pH 7.0 by pH meter 1:1 water; abrupt smooth boundary.

BC—38 to 48 inches (97 to 122 cm); yellowish red (5YR 5/6) very gravelly sandy loam, dark reddish brown (5YR 3/4) moist; 12 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; common very fine roots; many fine irregular pores; 60 percent clay films on rock fragments; 60 percent mixed gravel; neutral, pH 7.1 by pH meter 1:1 water; abrupt smooth boundary.

C—48 to 73 inches (122 to 185 cm); light brown (7.5YR 6/4) very gravelly sandy loam, brown (7.5YR 4/4) moist; 10 percent clay; massive; slightly hard, very friable, nonsticky, nonplastic; many fine irregular pores; 10 percent clay films on rock fragments; 5 percent fine black (N 2/0) manganese surface coatings; 60 percent mixed gravel; neutral, pH 7.2 by pH meter 1:1 water.

Type location: Butte County, California; about 1.5 miles south of Palermo, approximately 1,700 feet east and 2,300 feet south of the northwest corner of sec. 17, T. 18 N., R. 4 E.; 39 degrees, 35 minutes, 10 seconds north latitude and 121 degrees, 33 minutes, 0 seconds west longitude; NAD27; USGS Quad: Palermo, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm), and the depth to a very gravelly subsoil layer is 16 to 40 inches (41 to 102 cm). The mean annual soil temperature is 63 to 65 degrees F (17 to 18 degrees C). The particle-size control section averages 27 to 35 percent clay and 25 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur at a depth of 60 to more than 80 inches (152 cm to more than 203 cm) from December through March. Rock fragments on the surface range from 0 to 10 percent gravel.

The Ap horizon has dry color of 7.5YR 3/4 or 4/6 or 5YR 5/6. Moist color is 7.5YR 3/4 or 5YR 3/6. Texture is gravelly loam. The content of clay ranges from 13 to 26 percent. The content of gravel is 15 to 25 percent. The content of organic matter is 1.2 to 2 percent. Reaction is neutral or slightly alkaline.

The Bt horizon has dry color of 7.5YR 4/4 or 5/6 or 5YR 4/6 or 5/6. Moist color is 7.5YR 3/4 or 4/6 or 5YR 3/4, 3/6, 4/4, or 4/6. Texture is gravelly loam, gravelly clay loam, or very gravelly sandy clay loam. The content of clay ranges from 17 to 35 percent. The content of gravel is 15 to 60 percent. The content of organic matter is 0.5 to 0.9 percent. Reaction is neutral or slightly alkaline.

The BC horizon has dry color of 5YR 5/6. Moist color is 5YR 3/4 or 3/6. Texture is very gravelly sandy loam. The content of clay ranges from 12 to 18 percent. The content of gravel is 50 to 60 percent. The content of organic matter is 0 to 0.5 percent. Reaction is neutral or slightly alkaline.

The C horizon has dry color of 7.5YR 5/4 or 6/4. Moist color is 7.5YR 3/4 or 4/4. Texture is very gravelly sandy loam. The content of clay ranges from 10 to 20 percent. The content of gravel is 15 to 60 percent. The content of organic matter is 0 to 0.5 percent. Redoximorphic features occur as surface coatings of manganese. Reaction is neutral or slightly alkaline.

Powderhouse Series

The Powderhouse series consists of moderately deep, well drained soils that formed in tephra, residuum, and colluvium derived from volcanic mudflow, basalt, and andesite. These soils are on the tops and side slopes of ridges and nunataks on volcanic Sierra Nevada and Southern Cascade mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Medial-skeletal, glassy, frigid Humic Haploxerands

Typical Pedon

Powderhouse medial sandy loam, on a northwest-facing slope of 32 percent, under a cover of mixed conifers and shrubs, at an elevation of 4,800 feet (1,463 m). When described on 9/24/1996, the soil was moist throughout. Clay percentages are based on the apparent field texture. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); mat of fresh and slightly decomposed needles and twigs.

A1—2 to 4 inches (5 to 10 cm); dark grayish brown (10YR 4/2) medial sandy loam, black (10YR 2/1) moist; 10 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine irregular pores; extremely hydrophobic, smeary; 10 percent subrounded andesite gravel; very strongly acid, pH 5.0 by pH meter 1:1 water; NaF pH 10.3; abrupt smooth boundary.

A2—4 to 11 inches (10 to 28 cm); brown (10YR 4/3) medial sandy loam, very dark brown (10YR 2/2) moist; 12 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine roots; many very fine irregular pores; extremely hydrophobic, smeary; 10 percent subrounded andesite gravel; very strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 11.0; abrupt smooth boundary.

Bw—11 to 27 inches (28 to 69 cm); pale brown (10YR 6/3) very cobbly medial sandy loam, brown (10YR 4/3) moist; 14 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine and few medium and coarse roots; common very fine irregular pores; extremely hydrophobic, smeary; 30 percent subangular andesite cobbles and 20 percent subangular andesite gravel; very strongly acid, pH 5.0 by pH meter 1:1 water; NaF pH 11.1; abrupt smooth boundary.

C—27 to 36 inches (69 to 91 cm); pale brown (10YR 6/3) very gravelly medial coarse sandy loam, brown (10YR 4/3) moist; 12 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine and few medium and coarse roots; common very fine irregular pores; extremely hydrophobic, smeary; 10 percent well rounded andesite cobbles and 50 percent well rounded andesite gravel; very strongly acid, pH 4.8; NaF pH 10.8; abrupt wavy boundary.

Cr—36 to 82 inches (91 to 208 cm); moderately cemented mudflow with imbedded round andesitic gravel and cobbles; few very fine and fine roots matted around rock fragments; matrix can be dug with difficulty; fragments are indurated; few roots in fractures; 40 percent well rounded andesite cobbles and 25 percent well rounded andesite gravel.

Type location: Plumas County, California; about 2 miles south of Camel Peak Lookout, approximately 1,900 feet west and 1,850 feet north of the southeast corner of sec. 8, T. 21 N., R. 8 E.; 39 degrees, 41 minutes, 23.9 seconds north latitude and 121 degrees, 6 minutes, 25.3 seconds west longitude; NAD83; USGS Quad: American House, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The particle-size control section averages 10 to 15 percent clay and 35 to 80 percent rock fragments, mostly gravel and cobbles. Mineralogy is glassy. By ammonium acetate, base saturation ranges from 10 to 35 percent. P retention is more than 95 to a depth of 36 inches (91 cm). The melanic index is 1.70. Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders. Some pedons have a 2C horizon.

The A horizon has dry color of 10YR 4/2 or 4/3 or 7.5YR 3/2 or 4/2. Moist color is 10YR 2/1 or 2/2 or 5YR 2.5/1 or 3/2. Texture is dominantly medial sandy loam or medial fine sandy loam but in some pedons is gravelly medial sandy loam or very gravelly medial sandy loam. The content of clay ranges from 8 to 15 percent. The horizon has 5 to 20 percent gravel, 0 to 5 percent cobbles, and 0 to 10 percent stones. The content of organic matter is 12 to 35 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.9 to 3.5. The content of glass ranges from 17 to 18 percent. NaF pH is 10.0 to 12.0. Reaction ranges from very strongly acid to slightly acid.

The Bw horizon has dry color of 10YR 4/2, 5/3, 5/4, 6/3, or 7/3 or 7.5YR 5/3. Moist color is 10YR 2/2 or 4/3, 7.5YR 3/3 or 3/4, or 5YR 3/3. Texture is very cobbly medial sandy loam, very gravelly medial sandy loam, extremely cobbly medial sandy loam, or extremely cobbly medial coarse sandy loam. The content of clay ranges from 10 to 18 percent. The horizon has 20 to 40 percent gravel, 10 to 35 percent cobbles, and 10 to 20 percent stones. The content of organic matter is 9 to 12 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 1.7 to 2.5. The content of glass ranges from 10 to 30 percent. NaF pH is 11.0 to 11.5. Reaction ranges from very strongly acid to slightly acid.

The C horizon has dry color of 10YR 6/3 or 6/4. Moist color is 10YR 4/3 or 4/4. Texture is very gravelly, extremely gravelly, very cobbly, or extremely cobbly medial coarse sandy loam. The content of clay ranges from 10 to 15 percent. The horizon has 50 to 60 percent gravel, 0 to 35 percent cobbles, and 0 to 20 percent stones. The content of organic matter is 4 to 9 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.5 to 3.2. The content of glass ranges from 30 to 60 percent or more. NaF pH is 10.0 to 11.0. Reaction is very strongly acid or strongly acid.

Powellton Series

The Powellton series consists of very deep, well drained soils that formed in weathered tephra over residuum and colluvium derived from metadiorite, metavolcanic rocks, gabbro, or diorite. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 71 inches (1,803 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Fine-loamy, parasesquic, mesic Andic Haplohumults

Typical Pedon

Powellton gravelly loam, on a west-southwest-facing slope of 15 percent, under a cover of mixed conifers, at an elevation of 3,345 feet (1,020 m). When described on 11/28/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); pine litter.
Oe—0.5 inch to 2 inches (1 to 4 cm); partially decomposed pine litter.
A—2 to 4 inches (4 to 9 cm); reddish brown (5YR 5/3) gravelly loam, dark reddish brown (5YR 3/3) moist; 25 percent clay; strong fine granular structure; soft, very

friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine to medium and common coarse irregular and tubular pores; noneffervescent; 25 percent gravel; moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bt1—4 to 9 inches (9 to 22 cm); reddish brown (5YR 5/4) gravelly loam, dark reddish brown (5YR 3/4) moist; 23 percent clay; strong fine and medium granular structure; soft, very friable, slightly sticky, moderately plastic; many very fine to medium roots; many very fine and fine and common medium and coarse irregular and tubular pores; few distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 21 percent gravel and 5 percent subrounded cobbles; moderately acid, pH 5.7 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bt2—9 to 15 inches (22 to 37 cm); yellowish red (5YR 5/6) loam, red (2.5YR 4/6) moist; 26 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, moderately plastic; many very fine to medium and common coarse roots; many very fine to medium and common coarse irregular and tubular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 13 percent gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.0; clear smooth boundary.

Bt3—15 to 24 inches (37 to 60 cm); reddish yellow (5YR 6/6) clay loam, red (2.5YR 4/6) moist; 28 percent clay; strong medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine and coarse and many fine and medium roots; many very fine and fine and common medium and coarse tubular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 5 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 9.6; clear smooth boundary.

Bt4—24 to 30 inches (60 to 75 cm); reddish yellow (5YR 7/6) clay loam, red (2.5YR 4/6) moist; 29 percent clay; strong medium subangular blocky structure; moderately hard, firm, slightly sticky, moderately plastic; common very fine, fine, and coarse and many medium roots; many very fine and fine and common medium and coarse tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 2 percent gravel; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 9.4; clear smooth boundary.

Bt5—30 to 41 inches (75 to 105 cm); reddish yellow (7.5YR 7/6) silt loam, strong brown (7.5YR 5/8) moist; 24 percent clay; moderate medium subangular blocky structure; moderately hard, firm, slightly sticky, moderately plastic; common very fine and coarse and many fine and medium roots; many very fine and fine and common medium and coarse tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 2 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 9.3; gradual smooth boundary.

Bt6—41 to 61 inches (105 to 156 cm); reddish yellow (7.5YR 7/6) loam, strong brown (7.5YR 5/8) moist; 17 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium and coarse tubular pores; common faint discontinuous clay films on faces of peds and in pores; noneffervescent; strongly acid, pH 5.4 by pH meter 1:1 water; gradual smooth boundary.

Bt7—61 to 83 inches (156 to 212 cm); reddish yellow (7.5YR 8/6) loam, strong brown (7.5YR 5/8) moist; 18 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine tubular pores; common prominent discontinuous red (2.5YR 4/6) and common faint discontinuous clay films on faces of peds and in pores; noneffervescent; strongly acid, pH 5.3 by pH meter 1:1 water.

Type location: Butte County, California; about 0.5 mile north of Lovelock, approximately 800 feet south and 400 feet east of the northwest corner of sec. 31, T. 24 N., R. 4 E.; 39 degrees, 54 minutes, 59.7 seconds north latitude and 121 degrees, 34 minutes, 34.7 seconds west longitude; NAD27; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 54 to 56 degrees F (12 to 13 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 27 to 35 percent clay and 0 to 25 percent rock fragments, mostly gravel. Mineralogy is parasesquic. Acid oxalate extractable Al plus ½ Fe ranges from 1 to 1.6 to a depth of 15 inches (38 cm). Rock fragments on the surface range from 0 to 35 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 5YR 4/6, 5/3, 5/4, or 6/4 or 7.5YR 4/6, 5/4, 6/6, or 7/4. Moist color is 5YR 3/3, 4/3, 3/4, or 4/4; 7.5YR 3/3, 3/4, 4/3, or 4/4; or 2.5YR 2/4, 3/4, or 4/6. Texture is loam, silt loam, gravelly loam, very gravelly loam, gravelly sandy loam, or very gravelly sandy loam. The content of clay ranges from 18 to 27 percent. The content of gravel is 2 to 45 percent. The content of organic matter is 8 to 13 percent. By sum of cations, base saturation ranges from 35 to 45 percent. By ammonium acetate, CEC ranges from 20 to 30. NaF pH is 9.8 to 11. Reaction ranges from strongly acid to slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 4/6, 5/6, or 5/8 or 5YR 5/4, 4/6, 5/6, 6/4, 6/6, 6/8, or 7/6. Moist color is 7.5YR 3/4, 4/4, 4/6, or 5/6; 5YR 3/4, 4/3, 4/4, 4/6, 5/6, or 5/8; or 2.5YR 4/6. Texture is loam, gravelly loam, clay loam, or silty clay loam. The content of clay ranges from 22 to 35 percent. The content of gravel is 2 to 20 percent, and the content of cobbles 0 to 15 percent. The content of organic matter is 0.5 to 7 percent. By sum of cations, base saturation ranges from 25 to 35 percent. By ammonium acetate, CEC ranges from 8 to 20. NaF pH is 9.2 to 10.5. Reaction ranges from very strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 5YR 4/6, 4/8, 5/6, or 6/4; 7.5YR 6/6, 7/6, or 8/6; or 10YR 7/6 or 8/6. Moist color is 2.5YR 4/4, 4/6, 4/8, or 5/6; 5YR 4/6, 5/6, or 5/8; or 7.5YR 5/6, 5/8, 6/8, or 7/8. Texture is silt loam, loam, clay loam, silty clay loam, gravelly loam, or gravelly clay loam. The content of clay ranges from 17 to 35 percent. The content of gravel is 0 to 25 percent, and the content of cobbles is 0 to 25 percent. The content of organic matter is 0.1 to 1 percent. By sum of cations, base saturation ranges from 10 to 30 percent. By ammonium acetate, CEC ranges from 4 to 12. NaF pH is 9.0 to 9.8. Reaction ranges from very strongly acid to moderately acid.

Rackerby Series

The Rackerby series consists of shallow, well drained soils that formed in residuum and colluvium derived from intrusive igneous rocks, mainly quartz diorite. These soils are on side slopes on plutons on Sierra Nevada foothills. Slopes range from 15 to 30 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, thermic, shallow Typic Haploxerepts

Typical Pedon

Rackerby very gravelly sandy loam, on an east-facing slope of 21 percent, under a cover of blue oak, foothill pine, interior live oak, buckbrush, wild oat, rattlesnake brome, hedgehog dogtail, and Italian ryegrass, at an elevation of 1,770 feet (540 m).

When described on 9/14/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); dark yellowish brown (10YR 4/4) very gravelly sandy loam, dark brown (10YR 3/3) moist; 15 percent clay; moderate very fine and fine subangular blocky structure; slightly hard, very friable, nonsticky, nonplastic; many very fine roots; many very fine tubular pores; 40 percent subangular gravel; slightly acid, pH 6.4 by Hellige-Truog; abrupt smooth boundary.

AB—2 to 5 inches (5 to 13 cm); dark yellowish brown (10YR 4/4) gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; 18 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine tubular pores; 30 percent subangular gravel; slightly acid, pH 6.4 by Hellige-Truog; clear wavy boundary.

Bw—5 to 13 inches (13 to 33 cm); yellowish brown (10YR 5/4) very gravelly sandy loam, dark yellowish brown (10YR 4/6) moist; 20 percent clay; strong medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine and fine tubular pores; 5 percent subangular cobbles and 35 percent subangular gravel; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Cr—13 inches (33 cm); weakly cemented quartz diorite bedrock.

Type location: Butte County, California; about 2.4 miles southwest of Hurleton, approximately 2,000 feet south and 2,600 feet west of the northeast corner of sec. 34, T. 19 N., R. 5 E.; 39 degrees, 27 minutes, 46.71 seconds north latitude and 121 degrees, 23 minutes, 57.82 seconds west longitude; NAD83; USGS Quad: Bangor, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 59 to 63 degrees F (16 to 17 degrees C). The soil moisture control section is dry in all parts from about June through October (about 165 days). The particle-size control section averages 10 to 18 percent clay and 35 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 0 to 20 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones. Some pedons have a BA horizon.

The A horizon has dry color of 7.5YR 4/4, 4/6, or 5/4 or 10YR 4/4. Moist color is 7.5YR 3/3 or 3/4 or 10YR 3/3. Texture is gravelly loam, gravelly sandy loam, very gravelly sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 8 to 16 percent. The horizon has 15 to 40 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 3 to 5 percent. Reaction is slightly acid.

The AB horizon has dry color of 7.5YR 4/4, 4/6, 5/4, or 5/6 or 10YR 4/4. Moist color is 7.5YR 3/3, 3/4, or 4/4 or 10YR 3/4. Texture is gravelly loam, very gravelly loam, gravelly sandy loam, very gravelly sandy loam, or gravelly coarse sandy loam. The content of clay ranges from 10 to 20 percent. The horizon has 25 to 45 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. By sum of cations, base saturation ranges from 60 to 70 percent. The content of organic matter is 1.5 to 3 percent. Reaction is slightly acid.

The Bw horizon has dry color of 7.5YR 4/6, 5/4, or 5/6 or 10YR 5/4. Moist color is 7.5YR 3/4, 4/4, or 4/6 or 10YR 4/6. Texture is very cobbly loam, very gravelly sandy loam, extremely cobbly sandy loam, or very gravelly coarse sandy loam. The content of clay ranges from 10 to 20 percent. The horizon has 10 to 45 percent gravel, 5 to 70 percent cobbles, and 0 to 5 percent stones. By sum of cations, base saturation ranges from 60 to 74 percent. The content of organic matter is 0.2 to 1.0 percent. Reaction is slightly acid.

Redbone Series

The Redbone series consists of deep, well drained soils that formed in tephra over residuum derived from volcanic rocks. These soils are on the top of volcanic ridges in the Cascade Mountains. Slopes range from 2 to 30 percent. The mean annual precipitation is about 70 inches (1,778 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Medial over loamy-skeletal, amorphic over isotic, mesic Ultic Haploxerands

Typical Pedon

Redbone gravelly medial sandy loam, on a south-southwest-facing slope of 10 percent, under a cover of white fir, ponderosa pine, Douglas-fir, incense cedar, and sugar pine, at an elevation of 4,600 feet (1,402 m). When described on 8/7/1997, the soil was dry throughout. Clay percentages are based on the apparent field texture. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); needles and twigs.

Oe—1 to 2 inches (3 to 4 cm); partially decomposed needles and twigs.

A—2 to 4 inches (4 to 9 cm); reddish brown (5YR 5/4) gravelly medial sandy loam, dark reddish brown (2.5YR 3/4) moist; 14 percent clay; weak fine granular structure; loose, very friable, nonsticky, nonplastic; many very fine and common fine roots; many very fine to medium irregular and tubular pores; noneffervescent; 30 percent gravel; slightly acid, pH 6.3 by pH meter 1:1 water; NaF pH 10.6; abrupt smooth boundary.

Bt1—4 to 7 inches (9 to 19 cm); reddish brown (5YR 5/4) gravelly medial sandy loam, dark reddish brown (2.5YR 3/4) moist; 16 percent clay; weak fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; many very fine to medium roots; many very fine irregular and tubular pores; few clay bridges between sand grains; noneffervescent; 10 percent gravel; slightly acid, pH 6.3 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bt2—7 to 17 inches (19 to 42 cm); red (2.5YR 5/6) gravelly medial fine sandy loam, red (2.5YR 4/6) moist; 17 percent clay; weak fine and medium subangular blocky structure; loose, very friable, nonsticky, nonplastic; common very fine, many fine and medium, and few coarse roots; many very fine and fine irregular and tubular pores; common clay bridges between sand grains; noneffervescent; 30 percent gravel and 5 percent cobbles; moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.2; clear smooth boundary.

Bt3—17 to 28 inches (42 to 70 cm); brown (7.5YR 5/4) very gravelly fine sandy loam, reddish brown (5YR 4/3) moist; 17 percent clay; weak fine and medium subangular blocky structure; loose, very friable, nonsticky, nonplastic; common very fine, many fine and medium, and few coarse roots; many very fine and fine irregular and tubular pores; common clay bridges between sand grains; noneffervescent; 35 percent gravel and 5 percent cobbles; moderately acid, pH 5.6 by pH meter 1:1 water; NaF pH 10.0; clear smooth boundary.

Bt4—28 to 41 inches (70 to 103 cm); brown (7.5YR 5/4) very gravelly coarse sandy loam, reddish brown (5YR 4/3) moist; 17 percent clay; weak fine subangular blocky structure; loose, very friable, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine and fine irregular and tubular pores; few clay bridges between sand grains; noneffervescent; 45 percent gravel; moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.1; clear smooth boundary.

Bt5—41 to 54 inches (103 to 138 cm); brown (7.5YR 5/4) very gravelly coarse sandy loam, brown (7.5YR 4/4) moist; 15 percent clay; weak fine granular structure;

loose, very friable, nonsticky, nonplastic; common very fine and fine and few coarse roots; many very fine and fine irregular and tubular pores; few clay bridges between sand grains; noneffervescent; 50 percent gravel; slightly acid, pH 6.1 by pH meter 1:1 water; NaF pH 10.4; clear smooth boundary.

Cr—54 inches (138 cm); very weakly cemented, weathered mudflow bedrock; roots and fractures occurring more than 4 inches (10 cm) apart.

Type location: Butte County, California; about 1.7 miles east of Lomo, approximately 1,600 feet west and 2,400 feet north of the southwest corner of sec. 7, T. 25 N., R. 3 E.; in an unsectionized area; 40 degrees, 02 minutes, 20.64 seconds north latitude and 121 degrees, 35 minutes, 1.02 seconds west longitude; NAD83; USGS Quad: Butte Meadows, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 10 to 18 percent clay and 15 to 35 percent rock fragments, mostly gravel, in the upper part and 15 to 22 percent clay and 35 to 50 percent rock fragments, mostly gravel, in the lower part. Mineralogy is amorphic over isotic. Acid oxalate extractable Al plus $^1/_2$ Fe ranges from 2.2 to 2.6 to a depth of 16 inches (41 cm). P retention ranges from 85 to 96 percent throughout the profile. By sum of cations, base saturation ranges from 28 to 43 percent throughout the profile. Rock fragments on the surface range from 10 to 35 percent gravel, 0 to 15 percent cobbles, and 0 to 10 percent stones.

The A horizon has dry color of 7.5YR 4/3, 5/4, 6/3, or 6/4 or 5YR 5/4 or 6/3. Moist color is 7.5YR 3/2 or 3/3, 5YR 3/3 or 4/3, or 2.5YR 3/4. Texture is gravelly medial sandy loam, very gravelly medial sandy loam, or gravelly medial fine sandy loam. The content of clay ranges from 10 to 16 percent. The horizon has 15 to 30 percent gravel, 0 to 5 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 8 to 12 percent. NaF pH is 10 to 11.5. Reaction ranges from strongly acid to slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 5/4, 5/6, or 6/4; 5YR 5/4, 5/6, 6/4, or 6/6; or 2.5YR 5/6. Moist color is 7.5YR 3/3; 5YR 3/3, 4/3, 4/4, or 4/6; or 2.5YR 3/3, 3/4, or 4/6. Texture is gravelly medial sandy loam, very gravelly medial sandy loam, gravelly medial fine sandy loam, or gravelly medial loam. The content of clay ranges from 12 to 18 percent. The content of gravel is 15 to 35 percent, the content of cobbles is 0 to 5 percent, and the content of stones is 0 to 5 percent. The content of organic matter is 2 to 6 percent. NaF pH is 10 to 11.5. Reaction ranges from strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 10YR 5/4, 6/6, or 7/6 or 7.5YR 5/4, 5/6, or 6/4. Moist color is 10YR 4/3 or 4/4, 7.5YR 4/4 or 5/4, or 5YR 4/3. Texture is very gravelly sandy loam, extremely gravelly sandy loam, very gravelly fine sandy loam, very gravelly coarse sandy loam, or very gravelly sandy clay loam. The content of clay ranges from 15 to 22 percent. The content of gravel is 35 to 75 percent, the content of cobbles is 0 to 10 percent, and the content of stones is 0 to 10 percent. The content of organic matter is 0.5 to 2 percent. NaF pH is 9.7 to 10.5. Reaction ranges from very strongly acid to slightly acid.

Redding Series

The Redding series consists of moderately deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on mounds on intermediate terraces. Slopes range from 0 to 9 percent. The mean annual

precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, active, thermic Abruptic Durixeralfs

Typical Pedon

Redding loam, on an east-facing slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 105 feet (32 m). When described on 5/13/1992, the soil was moist below a depth of 10 inches (25 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 4 inches (0 to 10 cm); reddish yellow (7.5YR 6/6) loam, dark brown (7.5YR 3/4) moist; 22 percent clay; strong medium angular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine roots; few very fine irregular pores; 10 percent fine distinct light yellowish brown (10YR 6/4 dry) and brown (7.5YR 4/4 moist) oxidized iron masses; 5 percent rounded gravel; neutral, pH 6.8; abrupt smooth boundary.

A2—4 to 11 inches (10 to 28 cm); strong brown (7.5YR 5/6) loam, strong brown (5YR 4/6) moist; 24 percent clay; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine roots; few very fine tubular pores; 10 percent fine distinct reddish yellow (7.5YR 6/6 dry) and reddish yellow (7.5YR 6/8 moist) oxidized iron masses; 5 percent rounded gravel; neutral, pH 6.8; clear smooth boundary.

BA—11 to 24 inches (28 to 61 cm); yellowish red (5YR 5/6) loam, dark reddish brown (5YR 3/4) moist; 24 percent clay; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; common very fine irregular pores; 20 percent clay films on all faces of peds; 1 percent fine faint reddish yellow (5YR 6/6 dry) and yellowish red (5YR 4/6 moist) oxidized iron masses; 5 percent rounded gravel; neutral, pH 6.8; abrupt smooth boundary.

2Bt—24 to 35 inches (61 to 89 cm); yellowish red (5YR 5/6) clay, yellowish red (5YR 4/6) moist; 50 percent clay; moderate medium angular blocky structure; very hard, firm, moderately sticky, moderately plastic; few very fine tubular pores; 50 percent clay films on all faces of peds; 10 percent manganese coatings; 5 percent rounded gravel; neutral, pH 7.3; abrupt smooth boundary.

3Bqm—35 to 40 inches (89 to 102 cm); very gravelly very strongly cemented duripan; cemented by silica; 60 percent rounded gravel.

Type location: Butte County, California; about 3.2 miles northwest of Honcut, approximately 150 feet south and 2,000 feet east of the northwest corner of sec. 6, T. 18 N., R. 4 E.; 39 degrees, 21 minutes, 51 seconds north latitude and 121 degrees, 34 minutes, 6 seconds west longitude; NAD27; USGS Quad: Honcut, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 63 to 65 degrees F (17 to 18 degrees C). The particle-size control section averages 35 to 50 percent clay and 5 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 16 inches (41 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 0 to 5 percent gravel. Some pedons have an AB or Bt horizon.

The A horizon has dry color of 7.5YR 5/4, 5/6, 6/4, or 6/6 or 5YR 5/6. Moist color is 7.5YR 3/3, 3/4, or 4/6; 5YR 3/4, 4/4, or 4/6; or 2.5YR 3/4. Texture is loam, gravelly loam, sandy loam, gravelly sandy loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 12 to 26 percent. The content of gravel is 5 to 20 percent. The content of organic matter is 0.2 to 2 percent. By sum of cations, base saturation ranges from 60 to 75 percent. Redoximorphic features occur as oxidized

iron masses with dry color of 7.5YR 5/6, 5/8, 6/6, or 7/4 or 10YR 6/4 and manganese nodules with dry color of N 2/0. Reaction ranges from moderately acid to neutral.

The BA horizon has dry color of 7.5YR 5/4 or 5YR 5/6. Moist color is 7.5YR 3/4 or 5YR 3/4. Texture is loam, gravelly loam, sandy loam, or gravelly sandy loam. The content of clay ranges from 15 to 26 percent. The horizon has 0 to 30 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 0.1 to 0.5 percent. By sum of cations, base saturation ranges from 60 to 75 percent. Redoximorphic features occur as oxidized iron masses with dry color of 7.5YR 7/4, 10YR 6/4, or 5YR 6/6 and manganese nodules with dry color of N 2/0. Reaction ranges from moderately acid to neutral.

The Bt horizon, where it occurs, has dry color of 7.5YR 5/4 or 5YR 5/6. Moist color is 5YR 4/4 or 4/6 or 2.5YR 3/4. Texture is loam, gravelly loam, cobbly loam, clay loam, gravelly clay loam, cobbly clay loam, sandy clay loam, gravelly sandy clay loam, or cobbly sandy clay loam. The content of clay ranges from 18 to 34 percent. The horizon has 0 to 20 percent gravel and 0 to 10 percent cobbles. By sum of cations, base saturation ranges from 60 to 75 percent. Redoximorphic features occur as manganese nodules with dry color of N 2/0. Reaction is slightly acid or neutral.

The 2Bt horizon has dry color of 7.5YR 5/4, 5YR 5/6, or 2.5YR 4/6. Moist color is 5YR 4/4 or 4/6 or 2.5YR 3/4 or 3/6. Texture is clay, gravelly clay, or cobbly clay. The content of clay ranges from 40 to 50 percent. The horizon has an abrupt upper boundary with an absolute clay increase of 15 to 30 percent. It has 0 to 35 percent gravel and 0 to 20 percent cobbles. The content of organic matter is 0.5 to 1 percent. By sum of cations, base saturation ranges from 75 to 95 percent. Redoximorphic features occur as manganese nodules with dry color of N 2/0. Reaction is slightly acid or neutral.

The 3Bqm horizon has moist color of 10YR 3/4. It is very strongly cemented or indurated by silica. The content of gravel is 5 to 60 percent. The content of organic matter is 0 to 0.2 percent. Redoximorphic features occur as manganese coatings with color of N 2/0. Reaction is neutral.

Redsluff Series

The Redsluff series consists of very deep, moderately well drained soils that formed in overbank alluvium over channel alluvium derived from dominantly volcanic rocks. These soils are on low fan terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 24 inches (610 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Mollic Haploxeralfs

Typical Pedon

Redsluff gravelly loam, on a slope of less than 1 percent, under a cover of annual grasses, at an elevation of 184 feet (56 m). When described on 5/14/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Ap—0 to 2 inches (0 to 5 cm); light brown (7.5YR 6/3) gravelly loam, dark reddish brown (5YR 3/3) moist; 20 percent clay; weak medium subangular blocky structure parting to strong fine granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and few fine roots; many fine to coarse vesicular and tubular pores; 25 percent gravel; noneffervescent; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 5 inches (5 to 13 cm); light brown (7.5YR 6/3) gravelly loam, dark reddish brown (5YR 3/3) moist; 24 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and few fine roots; common fine and medium tubular pores; common distinct

continuous clay films on faces of peds; 25 percent gravel; noneffervescent; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

Bt2—5 to 12 inches (13 to 31 cm); brown (7.5YR 5/3) gravelly clay loam, dark reddish brown (5YR 3/3) moist; 28 percent clay; moderate medium subangular blocky structure; hard, very firm, moderately sticky, moderately plastic; common very fine and fine roots; many fine and medium tubular pores; many distinct continuous clay films on faces of peds; 15 percent gravel; noneffervescent; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt3—12 to 21 inches (31 to 53 cm); brown (7.5YR 5/3) gravelly loam, dark reddish brown (5YR 3/3) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine to medium tubular pores; many distinct continuous clay films throughout; 30 percent gravel; noneffervescent; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt4—21 to 29 inches (53 to 74 cm); light brown (7.5YR 6/3) gravelly loam, dark reddish brown (5YR 3/3) moist; 21 percent clay; moderate fine and medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine and fine tubular pores; many distinct continuous clay films on faces of peds; 25 percent gravel; noneffervescent; neutral, pH 6.8 by Hellige-Truog; clear wavy boundary.

Bt5—29 to 37 inches (74 to 94 cm); light brown (7.5YR 6/3) gravelly loam, brown (7.5YR 4/3) moist; 19 percent clay; weak fine and medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine and fine tubular pores; many distinct continuous clay films on faces of peds and in pores; 25 percent gravel; noneffervescent; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt6—37 to 42 inches (94 to 107 cm); light brown (7.5YR 6/3) extremely gravelly sandy loam, brown (7.5YR 4/3) moist; 15 percent clay; weak fine and medium subangular blocky structure; loose, nonsticky, nonplastic; common very fine and fine roots; many very fine and fine tubular pores; common faint continuous clay films on faces of peds; 40 percent gravel and 25 percent cobbles; noneffervescent; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

Cq—42 to 80 inches (107 to 203 cm); extremely gravelly loamy sand; 1 percent clay; single grain; loose, nonsticky, nonplastic; few very fine and fine roots; many very fine and fine interstitial pores; common fine and medium irregular rigid silica concretions under rock fragments; 45 percent gravel and 35 percent cobbles; noneffervescent; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 0.38 mile east of the intersection of Keefer Road and Highway 99, approximately 1,160 feet north and 2,450 feet east of the southwest corner of sec. 30, T. 23 N., R. 1 E.; 39 degrees, 48 minutes, 51.9 seconds north latitude and 121 degrees, 54 minutes, 34.7 seconds west longitude; NAD83; USGS Quad: Nord, California.

Range in Characteristics

Depth to the extremely gravelly or coarser substratum is 35 to 65 inches (89 to 165 cm). The mean annual soil temperature is 63 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 180 days). The particle-size control section averages 25 to 35 percent clay and 2 to 25 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur at a depth of 35 to 80 inches (89 to 203 cm) from December through April. Rock fragments on the surface range from 0 to 15 percent gravel and 0 to 5 percent cobbles. Some pedons have a weakly cemented Bq horizon below a depth of 60 inches (152 cm).

The Ap horizon has dry color of 10YR 5/3, 5/4, 6/3, or 6/4 or 7.5YR 4/3, 4/4, 5/3, or 6/3. Moist color is 7.5YR 3/2 or 3/3, 5YR 3/3, or 10YR 3/2 or 3/3. Texture is loam or gravelly loam. The content of clay ranges from 16 to 24 percent. The content of gravel is 0 to 30 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the Bt horizon has dry color of 7.5YR 5/3, 5/4, or 6/3 or 5YR 5/4. Moist color is 10YR 3/3 or 4/3; 7.5YR 3/2, 3/3, or 4/2; or 5YR 3/3 or 4/3. Texture is loam, clay loam, or the gravelly, cobbly, very gravelly, or very cobbly analogs of those textures. The content of clay ranges from 20 to 35 percent. The content of gravel is 5 to 30 percent, and the content of cobbles is 0 to 30 percent. Reaction ranges from slightly acid to slightly alkaline.

The lower part of the Bt horizon has dry color of 7.5YR 5/4, 6/3, or 6/4 or 5YR 5/4. Moist color is 7.5YR 4/3 or 4/4, 5YR 3/3 or 4/3, or 10YR 4/3. Texture is gravelly loam, extremely gravelly sandy loam, extremely gravelly coarse sandy loam, or extremely cobbly sandy loam. The content of clay ranges from 10 to 20 percent. The content of gravel is 25 to 70 percent, and the content of cobbles is 0 to 45 percent. Reaction is neutral or slightly alkaline.

The Cq horizon has dry color of 7.5YR 6/4 or 7/4. Moist color is 7.5YR 3/3 or 4/3 or 5YR 3/3. Texture is extremely gravelly loamy sand, extremely gravelly coarse sandy loam, or extremely cobbly coarse sandy loam. The content of clay ranges from 1 to 8 percent. The horizon has 10 to 50 percent gravel, 15 to 45 percent cobbles, and 0 to 5 percent stones. Reaction ranges from neutral to moderately alkaline.

Redsluff Taxadjunct

The Redsluff taxadjunct consists of very deep, moderately well drained soils that formed in alluvium derived from volcanic rocks. These soils are on stream terraces on Southern Cascade foothills. Slopes range from 0 to 2 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Typic Haploxeralfs

Typical Pedon

Redsluff taxadjunct clay loam, on a south-facing slope of 1 percent, under a cover of Mediterranean barley, yellow starthistle, ryegrass, soft chess, and red brome, at an elevation of 320 feet (98 meters). When described on 5/19/1999, the soil was dry to a depth of 10 inches (25 cm), very slightly moist from 10 to 68 inches (25 to 173 cm), and slightly moist from 68 to 80 inches (173 to 203 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 4 inches (0 to 10 cm); pale brown (10YR 6/3) clay loam, dark grayish brown (10YR 4/2) moist; 29 percent clay; moderate fine to coarse subangular blocky structure; rigid, friable, moderately sticky, moderately plastic; many very fine and fine roots; many very fine to medium tubular and irregular pores; 8 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt1—4 to 10 inches (10 to 25 cm); brown (10YR 5/3) sandy clay, dark grayish brown (10YR 4/2) moist; 40 percent clay; strong fine and medium subangular blocky structure; hard, friable, moderately sticky, very plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 2 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; gradual smooth boundary.

Bt2—10 to 21 inches (25 to 53 cm); brown (10YR 5/3) clay loam, dark grayish brown (10YR 4/2) moist; 36 percent clay; strong fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous

distinct clay films; 2 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt3—21 to 32 inches (53 to 81 cm); pale brown (10YR 6/3) sandy clay loam, dark grayish brown (10YR 4/2) moist; 32 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; common very fine and fine tubular pores; 80 percent continuous distinct clay films; 2 percent gravel; neutral, pH 6.9 by Hellige-Truog; gradual smooth boundary.

Bt4—32 to 42 inches (81 to 107 cm); very pale brown (10YR 7/3) sandy clay loam, dark grayish brown (10YR 4/2) moist; 30 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; common very fine and fine tubular pores; 60 percent discontinuous faint clay films; 2 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

2Bt5—42 to 53 inches (107 to 135 cm); pale brown (10YR 6/3) gravelly clay loam, brown (10YR 5/3) moist; 36 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; common very fine and fine tubular pores; 60 percent discontinuous distinct clay films; 15 percent gravel; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

2Bt6—53 to 68 inches (135 to 173 cm); very pale brown (10YR 8/3) extremely gravelly sandy clay loam, brown (10YR 5/3) moist; 30 percent clay; massive; slightly hard, friable, moderately sticky, moderately plastic; few very fine and fine roots; few very fine and fine tubular pores; 60 percent discontinuous distinct clay films; 15 percent cobbles and 40 percent gravel; slightly alkaline, pH 7.4 by Hellige-Truog; clear smooth boundary.

2Bt7—68 to 75 inches (173 to 191 cm); very pale brown (10YR 8/2) gravelly sandy clay loam, brown (10YR 5/3) moist; 23 percent clay; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine and fine roots; few very fine and fine tubular pores; 60 percent discontinuous faint clay films; 10 percent cobbles and 20 percent gravel; slightly alkaline, pH 7.8 by Hellige-Truog; clear smooth boundary.

3Cr—75 inches (191 cm); extremely weakly cemented volcanic sandstone bedrock; few very fine and fine roots; few very fine and fine tubular pores; slightly alkaline, pH 7.8 by Hellige-Truog.

Type location: Butte County, California; about 0.25 mile northwest of the Clark Road Butte College entrance, approximately 150 feet north and 50 feet west of the southeast corner of sec. 21, T. 21 N., R. 3 E.; 39 degrees, 39 minutes, 17 seconds north latitude and 121 degrees, 38 minutes, 13 seconds west longitude; NAD83; USGS Quad: Hamlin Canyon, California.

Range in Characteristics

The depth to paralithic bedrock is 60 to 85 inches (152 to 216 centimeters). The mean annual soil temperature is 63 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 180 days). The particle-size control section averages 35 to 43 percent clay and 0 to 5 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the bedrock and 36 inches (91 cm) below the surface of the soil from December through April and can occur 60 inches (152 cm) below the surface in May and June. Redoximorphic features, such as oxidized iron masses and manganese masses, occur in the 2Bt and 3Cr horizons. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 3 percent cobbles.

The Ap horizon has dry color of 10YR 5/2, 6/2, or 6/3. Moist color is 10YR 3/2 or 4/2. Texture is clay loam. The content of clay ranges from 27 to 35 percent. The content of gravel is 0 to 10 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 5/2, 5/3, 6/2, 6/3, 7/3, or 7/4. Moist color is 10YR 4/2, 4/3, or 5/4. Texture is clay loam, sandy clay loam, sandy clay, clay, gravelly clay loam, or gravelly sandy clay loam. The content of clay ranges from 27 to 45 percent. The content of gravel is 0 to 30 percent. Reaction ranges from slightly acid to slightly alkaline.

The 2Bt horizon has dry color of 10YR 6/3, 6/4, 7/3, 7/4, 8/2, or 8/3 or 2.5Y 7/1 or 7/2. Moist color is 10YR 4/3, 5/3, or 5/4 or 2.5Y 5/3. Texture is gravelly clay loam, gravelly sandy clay loam, very gravelly sandy clay loam, extremely gravelly sandy clay loam, gravelly coarse sandy loam, very gravelly loamy sand, extremely gravelly coarse sand, or extremely gravelly coarse sandy loam. The content of clay ranges from 2 to 36 percent. The horizon has 15 to 50 percent gravel and 0 to 25 percent cobbles. Reaction ranges from slightly acid to moderately alkaline.

The Redsluff taxadjunct is a taxadjunct because it has a fine particle-size control section and is lighter colored than is defined as the range for the series. These differences do not significantly affect the use, management, or interpretations of the soils.

Redswale Series

The Redswale series consists of very shallow, poorly drained soils that formed in alluvium derived from dominantly volcanic rocks. These soils are in swales on high fan terraces and strath terraces on Cascade foothills. Slopes range from 0 to 3 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic, shallow Typic Durixeralfs

Typical Pedon

Redswale cobbly loam, on a north-facing slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 277 feet (84 m). When described on 3/26/1997, the soil was dry to a depth of 1 inch (2.54 cm) and slightly moist from 1 to 7 inches (2.54 to 18 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 2.54 cm); reddish yellow (5YR 6/6) cobbly loam, dark reddish brown (2.5YR 3/4) moist; 19 percent clay; weak thin and medium platy structure parting to moderate fine subangular blocky; slightly hard, friable, slightly sticky, slightly plastic; common very fine roots; common very fine vesicular and tubular pores; noneffervescent; 10 percent gravel and 15 percent cobbles; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bt—1 to 7 inches (2.54 to 18 cm); yellowish red (5YR 5/6) very cobbly loam, dark reddish brown (2.5YR 3/4) moist; 26 percent clay; moderate medium subangular blocky structure; moderately hard, firm, slightly sticky, slightly plastic; common very fine roots; common very fine vesicular and tubular pores; many distinct continuous clay films on rock fragments and on faces of peds; common fine irregular very dark gray (N 3/0) soft iron-manganese masses between peds; noneffervescent; 15 percent gravel and 25 percent cobbles; neutral, pH 6.7 by Hellige-Truog; abrupt irregular boundary.

Bqm—7 inches (18 cm); indurated duripan; $^{1}/_{16}$-inch (2-mm) manganese capping.

Type location: Butte County, California; about 0.5 mile north of Rock Creek Road and 2.3 miles east of Meridian Road, approximately 2,700 feet north and 2,000 feet east of the southwest corner of sec. 16, T. 23 N., R. 1 E.; 39 degrees, 50 minutes,

53.04 seconds north latitude and 121 degrees, 52 minutes, 26.5 seconds west longitude; NAD83; USGS Quad: Richardson Springs Southeast, California.

Range in Characteristics

Depth to the duripan is 4 to 10 inches (10 to 25 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 to 180 days). The particle-size control section averages 18 to 25 percent clay and 35 to 60 percent rock fragments, mostly cobbles. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and the surface of the soil from November through March. Redoximorphic features, such as iron-manganese masses, iron-manganese concretions, and iron masses, occur in A and Bt horizons. Layers of manganese surface coatings 1/16 to 1/8 inch (2 to 3 mm) thick occur on top of the duripan. Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 40 percent cobbles, and 0 to 5 percent stones. Some pedons have an organic mat, 1/16 inch (2 mm) thick, on the surface.

The A horizon has dry color of 5YR 4/6, 5/6, or 6/6 or 7.5YR 5/4 or 6/4. Moist color is 5YR 3/2, 3/3, 3/4, or 4/3; 7.5YR 3/3; or 2.5YR 3/4. Texture is loam, gravelly loam, cobbly loam, or very cobbly loam. The content of clay ranges from 15 to 22 percent. The horizon has 2 to 20 percent gravel and 0 to 40 percent cobbles. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 5YR 5/6 or 6/4 or 7.5YR 4/4, 5/4, or 6/4. Moist color is 5YR 3/3, 4/3, or 4/4; 7.5YR 3/3; or 2.5YR 3/4. Texture is gravelly loam, very gravelly loam, cobbly loam, or very cobbly loam. The content of clay ranges from 18 to 27 percent. The horizon has 5 to 40 percent gravel and 0 to 35 percent cobbles. Reaction is slightly acid or neutral.

Redtough Series

The Redtough series consists of shallow, somewhat poorly drained soils that formed in alluvium derived from dominantly volcanic rocks. These soils are on mounds and risers on high fan terraces and strath terraces on Cascade foothills. Slopes range from 0 to 15 percent. The mean annual precipitation is about 24 inches (660 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy, mixed, superactive, thermic, shallow Typic Durixeralfs

Typical Pedon

Redtough loam, on a north-facing slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 278 feet (85 m). When described on 3/26/1997, the soil was dry to a depth of 1 inch (2.54 cm) and slightly moist from 1 to 13 inches (2.54 to 33 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 2.54 cm); reddish brown (5YR 5/4) loam, dark reddish brown (5YR 3/3) moist; 19 percent clay; moderate medium granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and common fine roots; many very fine vesicular and tubular pores; noneffervescent; 10 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt smooth boundary.

Bt1—1 to 7 inches (2.54 to 18 cm); yellowish red (5YR 5/6) gravelly loam, dark reddish brown (2.5YR 3/4) moist; 25 percent clay; moderate medium subangular blocky structure; moderately hard, firm, slightly sticky, slightly plastic; common very fine roots; common very fine vesicular and tubular pores; few faint patchy manganese or iron-manganese stains on faces of peds and many faint continuous clay films on rock fragments and on faces of peds; noneffervescent;

15 percent gravel and 5 percent cobbles; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt2—7 to 13 inches (18 to 33 cm); yellowish red (5YR 5/6) very cobbly loam, dark reddish brown (2.5YR 3/4) moist; 26 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine and common fine vesicular and tubular pores; many faint continuous clay films on faces of peds and on rock fragments; noneffervescent; 10 percent gravel and 25 percent cobbles; slightly acid, by 6.5 Hellige-Truog; abrupt irregular boundary.

Bqm—13 inches (33 cm); indurated duripan; 1/8-inch (3-mm) manganese capping.

Type location: Butte County, California; about 0.5 mile north of Rock Creek Road and 2.3 miles east of Meridian Road, approximately 2,700 feet north and 2,000 feet east of the southwest corner of sec. 16, T. 23 N., R. 1 E.; 39 degrees, 50 minutes, 53.04 seconds north latitude and 121 degrees, 52 minutes, 25.9 seconds west longitude; NAD83; USGS Quad: Richardson Springs Southeast, California.

Range in Characteristics

Depth to the duripan is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to November (150 to 180 days). The particle-size control section averages 18 to 27 percent clay and 5 to 35 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 2 inches (5 cm) below the surface of the soil from November through March. Redoximorphic features, such as oxidized iron masses and manganese masses, occur in the Bt horizon. Manganese surface coatings occur in layers 1/8 to 1/4 inch (3 to 5 mm) thick on top of the duripan. Some pedons have soft oxidized iron masses in the A horizon. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 10 percent cobbles. Some pedons have an organic crust, 1/16 inch (2 mm) thick, on the surface.

The A horizon has dry color of 5YR 4/6, 5/4, 5/6, or 6/6 or 7.5YR 5/4 or 6/4. Moist color is 7.5YR 3/3, 5YR 3/3 or 3/4, or 2.5YR 3/4. Texture is loam or gravelly loam. The content of clay ranges from 15 to 22 percent. The horizon has 0 to 35 percent gravel and 0 to 5 percent cobbles. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 5YR 4/6, 5/4, or 5/6 or 7.5YR 5/4 or 6/4. Moist color is 2.5YR 3/3 or 3/4; 5YR 3/3, 3/4, or 4/3; or 7.5YR 3/3. Texture is loam, gravelly loam, very gravelly loam, cobbly loam, or very cobbly loam. The content of clay ranges from 18 to 27 percent. The horizon has 5 to 40 percent gravel and 0 to 40 percent cobbles. Reaction is slightly acid or neutral.

Retsongulch Series

The Retsongulch series consists of moderately deep, well drained soils that formed in colluvium and residuum derived from coarse grained metamorphic rocks, mainly metadiorite. These soils are on canyon side slopes on metamorphic Sierra Nevada mountains. Slopes range from 50 to 100 percent. The mean annual precipitation is about 73 inches (1,854 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Loamy-skeletal, isotic, mesic Typic Haploxerults

Typical Pedon

Retsongulch very gravelly sandy loam, on an east-facing slope of 75 percent, under a cover of Douglas-fir, tanoak, ponderosa pine, canyon live oak, California black oak, sugar pine, incense cedar, and white fir, at an elevation of 3,300 feet (1,006 m). When

described on 8/10/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 3 inches (3 to 8 cm); pink (7.5YR 7/3) very gravelly sandy loam, brown (7.5YR 4/3) moist; 18 percent clay; moderate fine granular structure; soft, very friable, slightly sticky, nonplastic; many very fine and fine and few medium roots; many very fine to medium irregular and tubular pores; 5 percent cobbles and 30 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.7; clear smooth boundary.

Bt1—3 to 12 inches (8 to 30 cm); pink (7.5YR 7/4) very gravelly sandy clay loam, brown (7.5YR 5/4) moist; 23 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine to medium and few coarse roots; many very fine and fine and common medium tubular pores; 60 percent continuous distinct clay films; 5 percent stones, 10 percent cobbles, and 25 percent gravel; very strongly acid, pH 4.8 by Hellige-Truog; NaF pH 9.7; gradual smooth boundary.

Bt2—12 to 21 inches (30 to 53 cm); pink (7.5YR 7/4) extremely gravelly sandy clay loam, yellowish brown (10YR 5/6) moist; 20 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine to coarse roots; many very fine to medium tubular pores; 50 percent discontinuous faint clay films; 10 percent stones, 20 percent cobbles, and 35 percent gravel; very strongly acid, pH 4.8 by Hellige-Truog; NaF pH 9.5; gradual smooth boundary.

Bt3—21 to 30 inches (53 to 76 cm); very pale brown (10YR 8/4) extremely gravelly sandy loam, light yellowish brown (10YR 6/4) moist; 12 percent clay; weak fine subangular blocky structure; loose, nonsticky, nonplastic; many very fine to coarse roots; many very fine to medium tubular pores; 30 percent discontinuous faint clay films; 10 percent stones, 25 percent cobbles, and 35 percent gravel; very strongly acid, pH 4.8 by Hellige-Truog; NaF pH 9.5; clear wavy boundary.

R—30 inches (76 cm); strongly cemented metadiorite bedrock.

Type location: Butte County, California; about 0.7 mile east of Stirling City, approximately 1,275 feet south and 1,500 feet east of the northwest corner of sec. 27, T. 24 N., R. 4 E.; 39 degrees, 54 minutes, 43 seconds north latitude and 121 degrees, 31 minutes, 1 second west longitude; NAD83; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 47 to 55 degrees F (8 to 13 degrees C). The particle-size control section averages 12 to 27 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is isotic. Rock fragments on the surface range from 15 to 80 percent gravel, 0 to 15 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 7.5YR 6/3, 6/4, or 7/3 or 10YR 5/3, 5/4, or 6/3. Moist color is 7.5YR 4/2, 4/3, or 4/4 or 10YR 3/2, 3/3, or 4/3. Texture is gravelly sandy loam, very gravelly sandy loam, loam, gravelly loam, or very gravelly loam. The content of clay ranges from 10 to 22 percent. The horizon has 5 to 40 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 5/6, 6/4, 6/6, 7/4, or 7/6 or 10YR 6/4, 7/3, 7/4, or 8/4. Moist color is 7.5YR 4/4, 5/4, or 5/6 or 10YR 4/3, 4/4, 5/4, 5/6, or 6/4. Texture is gravelly sandy loam, very gravelly sandy loam, extremely gravelly sandy loam, gravelly loam, very gravelly loam, very gravelly sandy clay loam, or extremely

gravelly sandy clay loam. The content of clay ranges from 12 to 26 percent. The horizon has 25 to 50 percent gravel, 5 to 35 percent cobbles, 0 to 15 percent stones, and 0 to 10 percent boulders. Reaction ranges from very strongly acid to slightly acid.

Rockstripe Series

The Rockstripe series consists of very shallow, somewhat poorly drained soils that formed in residuum derived from volcanic mudflow breccia. These soils are on ridgetops and side slopes on Cascade foothills. Slopes range from 2 to 100 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 59 degrees F (15 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, nonacid, mesic Lithic Xerorthents

Typical Pedon

Rockstripe very gravelly loam, on a west-facing slope of 18 percent, under a cover of soft chess, hairy pink, wild oat, California brome, and scattered yellow starthistle, yerba santa, buckbrush, scrub oak, foothill pine, and manzanita, at an elevation of 1,280 feet (390 m). When described on 11/02/1998, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light reddish brown (5YR 6/4) very gravelly loam, reddish brown (5YR 4/3) moist; 21 percent clay; moderate fine subangular blocky structure parting to moderate fine granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine to medium tubular and irregular and common coarse tubular pores; 5 percent stones, 5 percent cobbles, and 25 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); reddish brown (5YR 5/4) very cobbly loam, reddish brown (5YR 4/3) moist; 23 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; common very fine to medium tubular pores; 30 percent discontinuous faint clay films; 20 percent cobbles and 20 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; gradual smooth boundary.

Bt2—6 to 9 inches (15 to 24 cm); reddish brown (5YR 5/4) cobbly loam, reddish brown (5YR 4/3) moist; 25 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; common very fine to medium tubular pores; 50 percent discontinuous distinct clay films; 15 percent cobbles and 15 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; abrupt smooth boundary.

R—9 inches (24 cm); indurated mudflow breccia bedrock.

Type location: Butte County, California; about 0.2 mile west-southwest of the intersection of Highway 32 and Santos Road, approximately 600 feet south and 2,600 feet west of the northeast corner of sec. 2, T. 22 N., R. 2 E.; 39 degrees, 47 minutes, 51 seconds north latitude and 121 degrees, 43 minutes, 21 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to lithic bedrock is 2 to 10 inches (5 to 25 cm). The mean annual soil temperature is 55 to 59 degrees F (13 to 15 degrees C). The particle-size control section averages 17 to 27 percent clay and 35 to 75 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 5 to 30 percent gravel, 0 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 7.5YR 6/2, 6/3, or 6/4 or 5YR 6/4. Moist color is 7.5YR 3/2, 3/4, or 4/3 or 5YR 4/3. Texture is very gravelly loam, very gravelly sandy clay loam, or very gravelly sandy loam. The content of clay ranges from 15 to 25 percent. The horizon has 25 to 45 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 5/4, 6/3, 6/4, or 7/3 or 5YR 5/4. Moist color is 7.5YR 3/4, 4/2, or 4/3 or 5YR 4/3. Texture is gravelly loam, very gravelly loam, cobbly loam, very cobbly loam, very gravelly sandy clay loam, or extremely stony sandy loam. The content of clay ranges from 17 to 27 percent. The horizon has 15 to 35 percent gravel, 0 to 30 percent cobbles, 0 to 30 percent stones, and 0 to 10 percent boulders. Reaction is slightly acid.

Rogerville Series

The Rogerville series consists of deep, well drained soils that formed in residuum and colluvium derived from ultramafic rocks, mainly talc schist. These soils are on ultramafic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 73 inches (1,854 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Fine, mixed, mesic Xeric Kanhaplohumults

Typical Pedon

Rogerville silt loam, on a southwest-facing slope of 12 percent, under a cover of mixed conifers, at an elevation of 3,975 feet (1,212 m). When described on 9/7/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed pine litter.

A—2 to 7 inches (5 to 18 cm); light brown (7.5YR 6/4) silt loam, reddish brown (5YR 4/4) moist; 23 percent clay; moderate fine and medium granular structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine and fine roots; many very fine and fine irregular, many medium irregular, and few coarse tubular pores; 5 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 9.4; clear smooth boundary.

Bt1—7 to 13 inches (18 to 33 cm); strong brown (7.5YR 5/6) silty clay loam, yellowish red (5YR 4/6) moist; 35 percent clay; strong fine angular blocky structure; slightly hard, very friable, moderately sticky, moderately plastic; many very fine and fine and common medium roots; many very fine and fine irregular, many medium irregular, and few coarse tubular pores; 75 percent discontinuous distinct clay films on faces of peds and in pores; 10 percent subangular gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 9.9; clear smooth boundary.

Bt2—13 to 24 inches (33 to 61 cm); strong brown (7.5YR 5/6) silty clay, yellowish red (5YR 4/6) moist; 40 percent clay; strong fine angular blocky structure; slightly hard, very friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine irregular, many medium irregular, and common medium tubular pores; 60 percent discontinuous distinct clay films on faces of peds and in pores; 15 percent subangular gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.4; clear smooth boundary.

Bt3—24 to 34 inches (61 to 86 cm); strong brown (7.5YR 5/8) gravelly silty clay loam, yellowish red (5YR 4/6) moist; 38 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common fine and medium and few very fine roots; many very fine and fine irregular and many medium tubular pores; 50 percent discontinuous distinct clay films on faces of peds and in pores; 5 percent subangular cobbles and 15 percent

subangular gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.4; clear smooth boundary.

Bt4—34 to 42 inches (86 to 107 cm); strong brown (7.5YR 5/8) gravelly clay loam, strong brown (7.5YR 5/6) moist; 35 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few fine roots; many fine tubular and many very fine and fine irregular pores; 35 percent discontinuous distinct clay films on faces of peds and in pores; 10 percent subangular cobbles and 25 percent subangular gravel; moderately acid, pH 5.8 by Hellige-Truog; abrupt smooth boundary.

Bt5—42 to 51 inches (107 to 130 cm); strong brown (7.5YR 5/8) extremely gravelly clay loam, strong brown (7.5YR 5/6) moist; 28 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common fine tubular and few very fine and fine irregular pores; 25 percent discontinuous distinct clay films on faces of peds and in pores; 20 percent subangular cobbles and 60 percent subangular gravel; moderately acid, pH 5.8 by Hellige-Truog; abrupt wavy boundary.

Cr—51 to 55 inches (130 to 140 cm); moderately cemented talc schist bedrock.

Type location: Butte County, California; about 4.2 miles northeast of Featherfalls, approximately 1,400 feet east and 100 feet north of the southwest corner of sec. 34, T. 21 N., R. 7 E.; 39 degrees, 37 minutes, 46 seconds north latitude and 121 degrees, 11 minutes, 6 seconds west longitude; NAD27; USGS Quad: Cascade, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The particle-size control section averages 36 to 50 percent clay and 0 to 20 percent rock fragments, mostly gravel. Mineralogy is mixed. By sum of cations, base saturation ranges from 20 to 35 percent to a depth of 13 inches (33 cm) and is less than 20 percent from 13 to 51 inches (33 to 130 cm). Calcium extractable bases exceed magnesium extractable bases throughout the profile.

The A horizon has dry color of 7.5YR 5/4 or 6/4 or 5YR 5/4, 5/6, or 6/4. Moist color is 7.5YR 4/4 or 5/3; 5YR 3/3, 3/4, 4/4, 4/6, or 5/6; or 2.5YR 3/4 or 4/6. Texture is silt loam, loam, or sandy loam. The content of clay ranges from 11 to 27 percent. The content of organic matter is 3 to 10 percent. The content of gravel is 5 to 15 percent. NaF pH is 9.4 to 11.5. Reaction ranges from very strongly acid to slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 5/6 or 5YR 5/4, 6/4, or 6/6. Moist color is 5YR 4/4 or 4/6 or 2.5YR 3/4, 4/4, or 4/6. Texture is silty clay loam, clay loam, gravelly silty clay loam, gravelly clay loam, or very gravelly clay loam. The content of clay ranges from 30 to 38 percent. The content of gravel is 10 to 50 percent. The content of organic matter is 3 to 10 percent. NaF pH is 9.5 to 9.9. Reaction is moderately acid or slightly acid.

The middle part of the Bt horizon has dry color of 7.5YR 5/6 or 5/8; 5YR 5/6, 5/8, or 6/6; or 2.5YR 5/6 or 6/6. Moist color is 7.5YR 5/6 or 5/8; 5YR 4/6, 5/6, or 5/8; or 2.5YR 3/6, 4/4, 4/6, 4/8, 5/6, or 6/6. Texture is silty clay, clay, silty clay loam, clay loam, gravelly clay loam, or gravelly silty clay loam. The content of clay ranges from 35 to 65 percent. The content of gravel is 0 to 35 percent, and the content of cobbles is 0 to 10 percent. The content of organic matter is 0.2 to 1 percent. NaF pH is 8.0 to 9.9. Reaction ranges from very strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 10YR 6/4 or 7/8, 7.5YR 7/8, or 5YR 6/6. Moist color is 10YR 5/4, 7.5YR 5/6 or 7/8, or 2.5YR 4/6 or 5/6. Texture is extremely gravelly clay loam, very gravelly silty clay loam, extremely gravelly silty clay loam, gravelly silty clay, silty clay, or silty clay loam. The content of clay ranges from 28 to 55 percent. The content of gravel is 5 to 80 percent, and the content of cobbles

is 0 to 20 percent. The content of organic matter is 0.2 to 0.5 percent. NaF pH is 8.8 to 9.9. Reaction ranges from very strongly acid to neutral.

Rogerville Taxadjunct

The Rogerville taxadjunct consists of deep, well drained soils that formed in tephra over residuum and colluvium derived from ultramafic rocks, mainly talc schist and soapstone. These soils are on ultramafic Sierra Nevada mountains. Slopes range from 30 to 50 percent. The mean annual precipitation is about 78 inches (1,981 mm), and the mean annual air temperature is about 47 degrees F (8 degrees C).

Taxonomic class: Fine-loamy, mixed, subactive, frigid Andic Haplohumults

Typical Pedon

Rogerville taxadjunct fine sandy loam, on a northwest-facing slope of 42 percent, under a cover of mixed conifers and shrubs, at an elevation of 5,180 feet (1,579 m). When described on 8/21/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oe—0 to 2 inches (0 to 5 cm); moderately decomposed plant material; abrupt smooth boundary.

A—2 to 4 inches (5 to 10 cm); reddish brown (5YR 5/4) fine sandy loam, dark reddish brown (5YR 3/3) moist; 10 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few very fine roots; many very fine irregular pores; 5 percent soapstone gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.5; abrupt smooth boundary.

Bw1—4 to 7 inches (10 to 18 cm); reddish brown (5YR 5/4) gravelly sandy loam, dark reddish brown (5YR 3/4) moist; 15 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine and fine roots; few very fine tubular pores; 30 percent soapstone gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.5; clear smooth boundary.

Bw2—7 to 21 inches (18 to 53 cm); reddish brown (5YR 5/4) very gravelly sandy loam, dark reddish brown (5YR 3/4) moist; 18 percent clay; weak very fine subangular blocky structure; soft, friable, nonsticky, nonplastic; many very fine to medium roots; common very fine tubular pores; 5 percent soapstone cobbles and 40 percent soapstone gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.5; clear wavy boundary.

Bw3—21 to 26 inches (53 to 66 cm); brown (7.5YR 5/4) very gravelly loam, dark reddish brown (5YR 3/4) moist; 22 percent clay; moderate very fine subangular blocky structure; soft, friable, slightly sticky, slightly plastic; common very fine to medium roots; common very fine tubular pores; 10 percent soapstone cobbles and 40 percent soapstone gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.0; clear smooth boundary.

2Bt1—26 to 33 inches (66 to 84 cm); reddish yellow (7.5YR 7/6) gravelly silt loam, strong brown (7.5YR 5/6) moist; 24 percent clay; moderate fine subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; common very fine to medium roots; common very fine tubular pores; 5 percent discontinuous distinct clay films on surfaces along pores; 10 percent soapstone stones and 20 percent soapstone gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 8.8; gradual smooth boundary.

2Bt2—33 to 44 inches (84 to 112 cm); reddish yellow (7.5YR 7/6) gravelly silt loam, strong brown (7.5YR 5/6) moist; 26 percent clay; moderate fine subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; few fine to coarse roots; common very fine tubular pores; 5 percent discontinuous distinct clay films on surfaces along pores; 10 percent soapstone gravel and 10 percent

soapstone stones; very strongly acid, pH 5.0 by Hellige-Truog; NaF pH 8.8; gradual smooth boundary.

2Bt3—44 to 57 inches (112 to 145 cm); reddish yellow (7.5YR 7/6) gravelly silty clay loam, strong brown (7.5YR 5/6) moist; 28 percent clay; moderate fine subangular blocky structure; slightly hard, firm, moderately sticky, moderately plastic; few fine to coarse roots; common very fine tubular pores; 5 percent discontinuous distinct clay films on surfaces along pores; 10 percent soapstone stones and 20 percent soapstone gravel; very strongly acid, pH 4.8 by Hellige-Truog; NaF pH 8.0; clear wavy boundary.

2Cr—57 inches (145 cm); moderately cemented soapstone bedrock.

Type location: Plumas County, California; about 1.5 miles north of Camel Peak Lookout, approximately 1,050 feet west and 600 feet south of the northeast corner of sec. 29, T. 22 N., R. 8 E.; 39 degrees, 44 minutes, 33 seconds north latitude and 121 degrees, 6 minutes, 12 seconds west longitude; NAD27; USGS Quad: American House, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The particle-size control section averages 25 percent clay and 24 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. The content of organic matter is 5 to 10 percent to a depth of 7 inches (18 cm) and is less than 5 percent from 7 to 57 inches (18 to 145 cm). By sum of cations, base saturation ranges from 10 to 25 percent throughout the profile. NaF pH is 10 to 11 to a depth of 5 to 24 inches (13 to 61 cm). Rock fragments on surface range from 0 to 10 percent gravel and 0 to 10 percent cobbles.

The A horizon has dry color of 5YR 5/4 or 7.5YR 4/3. Moist color is 5YR 3/3 or 7.5YR 3/3. Texture is fine sandy loam or sandy loam. The content of clay ranges from 8 to 12 percent. The content of gravel is 0 to 10 percent. Reaction ranges from very strongly acid to slightly acid.

The Bw horizon has dry color of 5YR 5/4 or 7.5YR 5/4. Moist color is 5YR 3/4. Texture is gravelly sandy loam, very gravelly sandy loam, or very gravelly loam. The content of clay ranges from 15 to 22 percent. The horizon has 20 to 40 percent gravel and 0 to 10 percent cobbles. Reaction ranges from strongly acid to slightly acid.

The 2Bt horizon has dry color of 7.5YR 6/6 or 7/6 or 5YR 5/6. Moist color is 7.5YR 4/6 or 5/6 or 5YR 3/4 or 4/6. Texture is gravelly silt loam or gravelly silty clay loam. The content of clay ranges from 24 to 28 percent. The horizon has 10 to 20 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones. Reaction is very strongly acid or strongly acid.

The Rogerville taxadjunct is a taxadjunct because it is frigid rather than mesic. This difference does not significantly affect the use, management, or interpretations of the soils.

Schott Series

The Schott series consists of deep, well drained soils that formed in residuum and colluvium derived from volcanic mudflow breccia. These soils are on ridgetops and side slopes in the Cascade Mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 71 inches (1,803 mm), and the mean annual air temperature is about 54 degrees F (12 degrees C).

Taxonomic class: Loamy-skeletal, mixed, semiactive, mesic Andic Haploxeralfs

Typical Pedon

Schott very gravelly loam, on an east-facing slope of 27 percent, under a cover of canyon live oak, ponderosa pine, California black oak, Douglas-fir, incense cedar, whiteleaf manzanita, Pacific poison oak, and California laurel, at an elevation of 2,940 feet (894 m). When described on 6/12/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed plant material; few very fine roots; abrupt smooth boundary.

A—2 to 6 inches (5 to 15 cm); light brown (7.5YR 6/4) very gravelly loam, brown (7.5YR 4/3) moist; 24 percent clay; strong fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to medium and common coarse tubular and irregular pores; 5 percent stones, 10 percent cobbles, and 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.5; abrupt smooth boundary.

Bt1—6 to 13 inches (15 to 33 cm); reddish brown (5YR 5/4) very gravelly clay loam, reddish brown (5YR 4/3) moist; 28 percent clay; moderate fine and medium granular structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium and common coarse roots; many very fine to medium and common coarse irregular and tubular pores; 80 percent continuous faint clay films; 5 percent stones, 10 percent cobbles, and 20 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; NaF pH 10.0; clear smooth boundary.

Bt2—13 to 22 inches (33 to 56 cm); reddish brown (5YR 5/4) very cobbly clay loam, reddish brown (5YR 4/4) moist; 30 percent clay; weak fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine to medium tubular pores; 80 percent continuous faint clay films; 10 percent stones, 20 percent gravel, and 30 percent cobbles; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.0; clear smooth boundary.

Bt3—22 to 40 inches (56 to 102 cm); reddish brown (5YR 5/4) extremely gravelly clay loam, reddish brown (5YR 4/4) moist; 32 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine to medium tubular pores; 80 percent continuous faint clay films; 10 stones, 30 percent cobbles, and 35 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; NaF pH 9.5; clear smooth boundary.

Bt4—40 to 50 inches (102 to 127 cm); brown (7.5YR 5/4) extremely gravelly sandy clay loam, brown (7.5YR 4/4) moist; 31 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous faint clay films; 10 percent stones, 30 percent cobbles, and 40 gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt smooth boundary.

R—50 inches (127 cm); strongly cemented mudflow breccia bedrock; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Butte County, California; about 1.25 miles east of Forest Ranch Cemetery, approximately 1,100 feet south and 300 feet west of the northeast corner of sec. 33, T. 24 N., R. 3 E.; 39 degrees, 53 minutes, 58 seconds north latitude and 121 degrees, 38 minutes, 13 seconds west longitude; NAD83; USGS Quad: Cohasset, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 52 to 59 degrees F (11 to 15 degrees C). The particle-size control

section averages 18 to 35 percent clay and 35 to 75 percent rock fragments, mostly gravel. Mineralogy is mixed. NaF pH is 9.5 to 11.0 to a depth of 20 inches (51 cm). Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 15 percent cobbles, 0 to 15 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 7.5YR 6/3 or 6/4 or 5YR 6/4. Moist color is 7.5YR 3/3, 4/3, or 4/4 or 5YR 3/3 or 4/3. Texture is sandy loam, gravelly sandy loam, gravelly loam, or very gravelly loam. The content of clay ranges from 15 to 25 percent. The horizon has 5 to 35 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. NaF pH is 9.5 to 10.5. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 5/4, 5/6, 6/4, or 6/6; 5YR 5/4, 5/6, or 6/4; or 10YR 6/4. Moist color is 7.5YR 3/3, 4/3, 4/4, 4/6, 5/4, or 5/6 or 5YR 4/3 or 4/4. Texture is the gravelly, very gravelly, extremely gravelly, or very cobbly analogs of sandy loam, sandy clay loam, loam, or clay loam. The content of clay ranges from 18 to 35 percent. The horizon has 15 to 70 percent gravel, 0 to 30 percent cobbles, and 0 to 10 percent stones. NaF pH is 9.0 to 11.0. Reaction ranges from strongly acid to slightly acid.

Shakeridge Series

The Shakeridge series consists of very deep, well drained soils that formed in mixed tephra and colluvium and residuum weathered from Lovejoy basalt. These soils are on backslopes and side slopes on basalt ridges on volcanic Sierra Nevada mountains. Slopes range from 0 to 70 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Medial-skeletal, ferrihydritic, mesic Humic Haploxerands

Typical Pedon

Shakeridge gravelly medial coarse sandy loam, on a northwest-facing slope of 48 percent, under a cover of mixed conifers, at an elevation of 4,580 feet (1,396 m). When described on 12/17/1996, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); fresh and slightly decomposed litter of needles, leaves, and twigs.

A1—2 to 4 inches (5 to 10 cm); dark brown (10YR 3/3) gravelly medial coarse sandy loam, black (10YR 2/1) moist; 9 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine roots; common very fine irregular and common very fine vesicular pores; 30 percent subangular basalt gravel; slightly acid, pH 6.3 by pH meter 1.1 water; NaF pH 10.4; abrupt smooth boundary.

A2—4 to 7 inches (10 to 18 cm); dark brown (10YR 3/3) extremely gravelly medial coarse sandy loam, very dark brown (10YR 2/2) moist; 9 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine and fine roots; common irregular pores; 65 percent subangular basalt gravel; slightly acid, pH 6.4 by pH meter 1:1 water; NaF pH 10.5; abrupt smooth boundary.

Bw1—7 to 19 inches (18 to 48 cm); brown (10YR 4/3) extremely gravelly medial coarse sandy loam, dark brown (7.5YR 3/3) moist; 16 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common very fine and fine and few medium roots; common irregular pores; 70 percent angular basalt gravel; slightly acid, pH 6.3 by pH meter 1:1 water; NaF pH 10.3; clear smooth boundary.

Bw2—19 to 25 inches (48 to 64 cm); brown (10YR 4/3) extremely gravelly medial coarse sandy loam, dark brown (7.5YR 3/2) moist; 16 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine and medium and few coarse roots; common irregular pores; 70 percent angular basalt gravel and 5 percent angular basalt cobbles; slightly acid, pH 6.5 by pH meter 1:1 water; NaF pH 10.3; gradual smooth boundary.

Bw3—25 to 36 inches (64 to 91 cm); brown (10YR 5/3) extremely gravelly medial coarse sandy loam, dark brown (7.5YR 3/2) moist; 18 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; few very fine and common fine to coarse roots; common irregular pores; 70 percent subangular basalt gravel and 5 percent subangular basalt cobbles; slightly acid, pH 6.1 by pH meter 1:1 water; NaF pH 10.3; gradual smooth boundary.

Bw4—36 to 55 inches (91 to 140 cm); brown (10YR 5/3) very gravelly medial coarse sandy loam, dark brown (7.5YR 3/2) moist; 18 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine to coarse roots; common irregular pores; 50 percent subangular basalt gravel and 5 percent subangular basalt cobbles; moderately acid, pH 6.0 by pH meter 1:1 water; NaF pH 10.4; gradual smooth boundary.

Bw5—55 to 71 inches (140 to 180 cm); brown (10YR 5/3) extremely gravelly medial coarse sandy loam, dark brown (7.5YR 3/2) moist; 18 percent clay; moderate fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine to coarse roots; common irregular pores; 55 percent subangular basalt gravel and 5 percent subangular basalt cobbles; slightly acid, pH 6.1 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bw6—71 to 87 inches (180 to 221 cm); brown (10YR 5/3) extremely gravelly coarse sandy loam, dark brown (7.5YR 3/2) moist; 18 percent clay; weak very fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; common fine and medium roots; common irregular pores; 60 percent subangular basalt gravel and 5 percent subangular basalt cobbles; moderately acid, pH 5.9 by pH meter 1:1 water; NaF pH 10.5.

Type location: Plumas County, California; about 2.3 miles southeast of Cascade, approximately 1,250 feet north and 1,200 feet east of the southwest corner of sec. 13, T. 21 N., R. 7 E.; 39 degrees, 40 minutes, 29.7 seconds north latitude and 121 degrees, 8 minutes, 57.5 seconds west longitude; NAD83; USGS Quad: Cascade, California.

Range in Characteristics

The depth to lithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 47 to 54 degrees F (11 to 12 degrees C). The soil moisture control section is dry in all parts from about July to September (about 90 days). The particle-size control section averages 12 to 18 percent clay and 40 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is ferrihydritic. By ammonium acetate, base saturation is more than 50 percent throughout the profile. Acid oxalate extractable Al plus $^1/_2$ Fe ranges from 2.1 to 3.3 to a depth of 71 inches (180 cm). Rock fragments on the surface range from 10 to 20 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. Some pedons have paralithic contact of volcaniclastic material, tuff, or mudflow breccia below a depth of 60 inches (152 cm).

The A horizon has dry color of 10YR 3/2 or 3/3. Moist color is 10YR 2/1 or 2/2 or 7.5YR 2.5/2. Texture is gravelly medial coarse sandy loam, very gravelly medial sandy loam, or extremely gravelly medial sandy loam. The content of clay ranges from 5 to 12 percent. The horizon has 20 to 65 percent gravel and 5 to 20 percent cobbles. The content of organic matter is 5 to 12 percent. NaF pH is 10.4 to 11.5. Reaction is moderately acid or slightly acid.

The Bw horizon has dry color of 10YR 4/3 or 5/3. Moist color is 10YR 3/2 or 7.5YR 3/2, 3/3, or 4/4. Texture is extremely gravelly medial sandy loam, very gravelly medial sandy loam, very gravelly medial coarse sandy loam, extremely gravelly medial coarse sandy loam, extremely gravelly coarse sandy loam, extremely cobbly medial sandy loam, or extremely stony medial sandy loam. The content of clay ranges from 5 to 18 percent. The horizon has 10 to 70 percent gravel, 0 to 50 percent cobbles, and 0 to 70 percent stones. The content of organic matter is 1 to 3 percent. NaF pH is 10.3 to 11.0. Reaction ranges from very strongly acid to slightly acid.

Sites Series

The Sites series consists of deep or very deep, well drained soils that formed in material weathered from metamorphic rocks. These soils are on metamorphic Sierra Nevada mountains. Slopes range from 2 to 50 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine, parasesquic, mesic Xeric Haplohumults

Typical Pedon

Sites loam, 3 to 8 percent slopes. (Colors are for dry soil unless otherwise noted.)

Oi—4 inches to 0 (10 cm to 0); partially decomposed needles, leaves, twigs, and bark.

A—0 to 6 inches (0 to 15 cm); strong brown (7.5YR 4/6) loam, dark brown (7.5YR 3/4) moist; strong fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many fine and medium roots; many very fine irregular and tubular pores; slightly acid; clear smooth boundary.

Bt1—6 to 16 inches (15 to 41 cm); yellowish red (5YR 4/6) clay loam, yellowish red (5YR 4/6) moist; moderate medium subangular blocky structure; soft, very friable, sticky, slightly plastic; many fine and medium roots; common very fine irregular pores; common thin clay films on faces of peds; moderately acid; clear wavy boundary.

Bt2—16 to 27 inches (41 to 69 cm); yellowish red (5YR 4/6) clay, red (2.5YR 4/6) moist; moderate medium subangular blocky structure; soft, very friable, sticky, slightly plastic; many medium and coarse and common fine roots; common fine to coarse tubular pores; many thin clay films on faces of peds; moderately acid; gradual smooth boundary.

Bt3—27 to 40 inches (69 to 102 cm); red (2.5YR 4/6) clay, dark reddish brown (2.5YR 3/4) moist; strong medium subangular blocky structure; slightly hard, friable, sticky, slightly plastic; few fine and medium roots; common fine to coarse tubular pores; many thin clay films on faces of peds; moderately acid; gradual smooth boundary.

Bt4—40 to 51 inches (102 to 130 cm); red (2.5YR 4/6) clay, dark reddish brown (2.5YR 3/4) moist; strong medium subangular blocky structure; slightly hard, friable, sticky, slightly plastic; few fine and medium roots; common fine and medium tubular pores; many thin clay films on faces of peds; strongly acid; clear wavy boundary.

Bt5—51 to 61 inches (130 to 155 cm); reddish brown (2.5YR 4/4) clay loam, dark reddish brown (2.5YR 3/4) moist; moderate medium subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; common fine and medium roots; common fine and medium tubular pores; common thin clay films on faces of peds and in pores; strongly acid; clear irregular boundary.

Cr—61 to 71 inches (155 to 180 cm); mixed red (2.5YR 4/6) and strong brown (7.5YR 5/8), soft schist bedrock, tilted at about 60 degrees from horizontal.

Type location: Yuba County, California, in the town of Challenge, approximately 1,600 feet north and 800 feet east of the southeast corner of sec. 19, T. 19 N., R. 7 E.; 39 degrees, 29 minutes, 14 seconds north latitude and 121 degrees, 13 minutes, 28 seconds west longitude; NAD27; USGS Quad: Challenge, California.

Range in Characteristics

The depth to paralithic bedrock ranges from 40 to more than 80 inches (102 to more than 203 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July 15 to October 15 (about 95 days). Mineralogy is parasesquic. The content of organic matter is 2 to 10 percent to a depth of 5 inches (13 cm).

The A horizon has dry color of 7.5YR 5/4 or 4/6 or 5YR 4/4. Moist color is 7.5YR 3/4 or 5YR 3/4 or 3/3. Texture is loam, clay loam, or gravelly loam. The content of clay ranges from 15 to 27 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 4/6, 4/8, or 5/6 or 2.5YR 4/6, 4/4, 3/6, or 5/8. Moist color is 5YR 4/6 or 3/3 or 2.5YR 3/4, 3/6, or 4/6. Texture is clay loam, clay, gravelly clay loam, or gravelly clay. By weighted average, the content of clay in the control section ranges from 35 to 60 percent. The content of rock fragments is 0 to 30 percent. The content of organic carbon is 2 to 3 percent in the upper part of the horizon and 1 to 2 percent in the lower part. Base saturation ranges from 15 to 30 percent. Reaction is strongly acid or moderately acid.

Sites Taxadjunct

The Sites taxadjunct consists of very deep, well drained soils that formed in tephra deposited over colluvium and residuum derived from metasedimentary rocks. These soils are on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 70 inches (1,778 mm), and the mean annual air temperature is about 52 degrees F (11 degrees C).

Taxonomic class: Fine, parasesquic, mesic Andic Palehumults

Typical Pedon

Sites taxadjunct gravelly loam, on a northwest-facing slope of 18 percent, under a cover of Sierra mixed conifers, at an elevation of 3,225 feet (983 m). When described on 6/4/2004, the soil was dry to a depth of 21 inches (53 cm) and moist from 21 to 72 inches (53 to 183 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 3 inches (3 to 8 cm); brown (7.5YR 5/3) gravelly loam, reddish brown (5YR 4/4) moist; 18 percent clay; strong fine granular structure; soft, very friable, nonsticky, slightly plastic; many very fine roots; many very fine irregular pores; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; abrupt smooth boundary.

BA—3 to 10 inches (8 to 25 cm); yellowish red (5YR 5/6) very gravelly loam, red (2.5YR 4/6) moist; 25 percent clay; moderate fine granular structure; soft, friable, slightly sticky, slightly plastic; common fine and medium and many very fine roots; many very fine irregular pores; 45 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 9.8; abrupt smooth boundary.

Bt1—10 to 21 inches (25 to 53 cm); yellowish red (5YR 5/6) gravelly silty clay, red (2.5YR 4/6) moist; 45 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common fine and medium and few coarse roots; common very fine tubular pores; 50 percent discontinuous distinct clay films on all faces of peds; 25 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.

Bt2—21 to 34 inches (53 to 86 cm); reddish yellow (5YR 6/6) gravelly silty clay, red (2.5YR 5/6) moist; 50 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, very plastic; few medium and coarse roots; common very fine tubular pores; 60 percent continuous distinct clay films on all faces of peds; 20 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; gradual smooth boundary.

Bt3—34 to 59 inches (86 to 150 cm); reddish yellow (5YR 6/6) silty clay, red (2.5YR 5/6) moist; 55 percent clay; moderate medium subangular blocky structure parting to moderate fine subangular blocky; slightly hard, friable, slightly sticky, very plastic; few fine and medium roots; common very fine tubular pores; 90 percent continuous distinct clay films on all faces of peds; 10 percent gravel; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.

Bt4—59 to 72 inches (150 to 183 cm); reddish yellow (5YR 6/6) silty clay, red (2.5YR 5/6) moist; 45 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, very plastic; few fine and medium roots; common very fine tubular pores; 90 percent continuous distinct clay films on all faces of peds; 10 percent gravel; slightly acid, pH 6.2 by Hellige-Truog.

Type location: Butte County, California; about 0.3 mile northeast of the town of Feather Falls, approximately 1,900 feet west and 1,750 feet south of the northeast corner of sec. 13, T. 20 N., R. 6 E.; 39 degrees, 35 minutes, 44 seconds north latitude and 121 degrees, 14 minutes, 50 seconds west longitude; NAD83; USGS Quad: Clipper Mills, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 47 to 52 degrees F (8 to 11 degrees C). The particle-size control section averages 50 to 55 percent clay and 20 to 25 percent rock fragments, mostly gravel. Mineralogy is parasesquic. Acid-oxalate extractable Al plus $^1/_2$ Fe ranges from 1.5 to 1.0 percent (by weight) to a depth of 10 inches (25 cm). Rock fragments on the surface range from 0 to 15 percent gravel.

The A horizon has dry color of 7.5YR 5/3 or 5/4, 5YR 5/4 or 6/6, or 2.5YR 4/6. Moist color is 5YR 3/4 or 4/4, 7.5YR 3/3 or 3/4, or 2.5YR 3/4 or 4/6. Texture is gravelly loam, loam, sandy loam, or gravelly sandy loam. The content of clay ranges from 16 to 25 percent. The content of gravel is 0 to 25 percent. The content of organic matter is 10 to 14 percent. By sum of cations, base saturation ranges from 15 to 25 percent. By ammonium acetate, CEC ranges from 20 to 30. NaF pH is 10.0 to 11.0. Reaction is moderately acid or slightly acid.

The BA horizon has dry color of 5YR 5/6 or 2.5YR 4/6. Moist color is 2.5YR 3/6 or 4/6 or 5YR 3/3, 3/4, or 4/4. Texture is gravelly loam, very gravelly loam, loam, or clay loam. The content of clay ranges from 19 to 30 percent. The content of gravel is 0 to 45 percent. The content of organic matter is 4 to 8 percent. By sum of cations, base saturation ranges from 10 to 20 percent. By ammonium acetate, CEC ranges from 12 to 20. NaF pH is 9.8 to 11.0. Reaction ranges from strongly acid to slightly acid.

The Bt horizon has dry color of 5YR 5/6, 5/8, or 6/6 or 7.5YR 6/8 or 7/8. Moist color is 2.5YR 3/6, 4/6, 4/8, or 5/6; 7.5YR 5/8, 6/8, or 7/8; or 5YR 5/8. Texture is gravelly silty clay, silty clay, clay, or clay loam. The content of clay ranges from 38 to 55 percent. The content of gravel is 0 to 25 percent. The content of organic matter is 3 to 0.3 percent. By sum of cations, base saturation ranges from 2 to 20 percent. By ammonium acetate, CEC ranges from 9 to 12. NaF pH is 8.8 to 10.0. Reaction ranges from very strongly acid to slightly acid.

The Sites taxadjunct is a taxadjunct because it has andic soil material on the surface and its content of clay does not decrease by 30 percent from the maximum amount in the argillic horizon. These differences do not significantly affect the use, management, or interpretations of the soils.

Slideland Series

The Slideland series consists of very deep, well drained soils that formed in colluvium and alluvium derived from mixed rock sources. These soils are in areas of landslide deposits and terraces in canyons on Cascade foothills. Slopes range from 3 to 50 percent. The mean annual precipitation is about 40 inches (1,016 mm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Haplic Palexeralfs

Typical Pedon

Slideland gravelly loam, on a west-facing slope of 11 percent, under a cover of annual grasses and forbs with some scattered blue oak and whiteleaf manzanita, at an elevation of 620 feet (189 m). When described on 7/8/1999, the soil was dry to a depth of 38 inches (97 cm) and very slightly moist from 38 to 80 inches (97 to 203 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 23 percent clay; moderate medium platy structure parting to moderate fine and medium granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine roots; common very fine to medium irregular and tubular pores; 15 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 9 inches (5 to 23 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 25 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and few medium roots; common very fine and fine and few medium tubular pores; 70 percent continuous distinct clay films on surfaces along pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt2—9 to 14 inches (23 to 36 cm); light brown (7.5YR 6/4) gravelly clay loam, brown (7.5YR 4/3) moist; 28 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine and fine and few medium roots; many very fine to medium tubular pores; 70 percent continuous distinct clay films on surfaces along pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt3—14 to 21 inches (36 to 53 cm); light reddish brown (5YR 6/4) gravelly clay loam, reddish brown (5YR 4/3) moist; 31 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine and fine and few medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films on surfaces along pores; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt4—21 to 28 inches (53 to 71 cm); light reddish brown (5YR 6/4) gravelly clay loam, reddish brown (5YR 4/3) moist; 34 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine to coarse roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films on surfaces along pores; 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt5—28 to 38 inches (71 to 97 cm); light reddish brown (5YR 6/4) gravelly clay loam, reddish brown (5YR 4/3) moist; 36 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films on surfaces along pores; 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt6—38 to 51 inches (97 to 130 cm); light reddish brown (5YR 6/4) gravelly clay loam, reddish brown (5YR 4/3) moist; 37 percent clay; moderate fine and medium

subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; few very fine to coarse roots; many very fine and fine and few medium tubular pores; 80 percent continuous distinct clay films on surfaces along pores; 5 percent cobbles and 10 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt7—51 to 69 inches (130 to 175 cm); light reddish brown (5YR 6/4) very cobbly clay loam, reddish brown (5YR 4/3) moist; 39 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, very sticky, very plastic; few very fine to medium roots; common very fine and fine tubular pores; 100 percent continuous distinct clay films on surfaces along pores; 5 percent stones, 15 percent gravel, and 15 percent cobbles; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt8—69 to 80 inches (175 to 203 cm); light brown (7.5YR 6/4) very cobbly clay loam, brown (7.5YR 4/3) moist; 38 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, very sticky, very plastic; few very fine to medium roots; common very fine and fine tubular pores; 80 percent continuous distinct clay films on surfaces along pores; 15 percent medium distinct irregular iron-manganese masses that have clear boundaries and are between peds; 5 percent stones, 20 percent cobbles, and 20 percent gravel; neutral, pH 6.8 by Hellige-Truog.

Type location: Butte County, California; about 2.4 miles south-southwest of Centerville, approximately 2,400 feet east and 1,000 feet south of the northwest corner of sec. 20, T. 22 N., R. 3 E.; 39 degrees, 45 minutes, 11 seconds north latitude and 121 degrees, 39 minutes, 56 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The particle-size control section averages 25 to 35 percent clay and 5 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders. In some pedons the clay content ranges from 20 to 35 percent in the lower part of the Bt horizon.

The A horizon has dry color of 7.5YR 5/3, 6/3, or 6/4. Moist color is 7.5YR 4/2, 4/3, or 4/4 or 5YR 4/3. Texture is loam, gravelly loam, fine sandy loam, or very fine sandy loam. The content of clay ranges from 18 to 27 percent. The content of gravel is 2 to 30 percent. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 7.5YR 5/3, 5/4, 6/3, 6/4, 6/6, or 7/4 or 5YR 5/4 or 6/4. Moist color is 7.5YR 4/3 or 4/4 or 5YR 4/3 or 4/4. Texture is loam, gravelly loam, clay loam, gravelly clay loam, cobbly clay loam, silt loam, or silty clay loam. The content of clay ranges from 20 to 35 percent. The content of gravel is 5 to 30 percent, the content of cobbles is 0 to 10 percent, and the content of stones is 0 to 5 percent. Reaction ranges from moderately acid to neutral.

The lower part of the Bt horizon has dry color of 7.5YR 4/4, 5/4, 6/4, or 7/4 or 5YR 4/6, 5/4, or 6/4. Moist color is 7.5YR 4/3, 4/4, or 5/4 or 5YR 4/4 or 4/4. Texture is clay loam, gravelly clay loam, cobbly clay loam, very cobbly clay loam, silty clay loam, very gravelly silty clay loam, very cobbly silty clay loam, clay, gravelly clay, cobbly clay, silty clay, or gravelly silty clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 5 to 30 percent, the content of cobbles is 0 to 25 percent, and the content of stones is 0 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

Sobrante Series

The Sobrante series consists of moderately deep, well drained soils that formed in material weathered from basic metavolcanic rocks. These soils are on metavolcanic Sierra Nevada foothills. Slopes range from 3 to 75 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Mollic Haploxeralfs

Typical Pedon

Sobrante loam, on a slope of 3 to 8 percent. (Colors are for dry soil unless otherwise noted.)

A—0 to 5 inches (0 to 13 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/4) moist; weak fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine irregular pores; 5 percent gravel; slightly acid; clear smooth boundary.

Bt1—5 to 11 inches (13 to 28 cm); dark reddish brown (5YR 3/4) loam, dark reddish brown (5YR 3/4) moist; moderate medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine to medium tubular pores; few thin clay films on faces of peds and in pores; 5 percent gravel; slightly acid; gradual smooth boundary.

Bt2—11 to 19 inches (28 to 48 cm); dark reddish brown (5YR 3/4) loam, dark reddish brown (5YR 3/4) moist; moderate medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few fine and common medium roots; common very fine and fine tubular pores; common thin clay films on faces of peds and in pores; 5 percent gravel; slightly acid; gradual smooth boundary.

Bt3—19 to 27 inches (48 to 69 cm); strong brown (7.5YR 5/6) loam, dark brown (7.5YR 3/4) moist; weak fine subangular blocky structure; hard, firm, slightly sticky, slightly plastic; few fine and common medium roots; few fine tubular pores; common moderately thick clay films on faces of peds and in pores; 5 percent gravel; slightly acid; abrupt wavy boundary.

Cr—27 to 39 inches (69 to 99 cm); yellowish brown (10YR 5/8), weathered greenstone bedrock; soft in the upper part, becoming increasingly hard with increasing depth; common fine and coarse roots; gradual wavy boundary.

R—39 inches (99 cm); hard, very fractured greenstone bedrock.

Type location: Yuba County, California; about 4.2 miles northeast of Camp Far West Reservoir Dam, approximately 1,650 feet north and 1,450 feet west of the southeast corner of sec. 34, T. 15 N., R. 6 E.; 39 degrees, 6 minutes, 20 seconds north latitude and 121 degrees, 17 minutes, 19 seconds west longitude; NAD27; USGS Quad: Camp Far West, California.

Range in Characteristics

The depth to lithic bedrock ranges from 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 64 degrees F (15 to 18 degrees C). The particle-size control section ranges from 25 to 35 percent clay. Mineralogy is mixed. The content of organic matter is 1 to 3 percent to a depth of 5 inches (13 cm).

The A horizon has dry color of 7.5YR 5/4 or 4/4. Moist color is 7.5YR 4/4 or 3/4. Texture is gravelly loam or loam. The content of clay ranges from 10 to 25 percent. The horizon has 3 to 25 percent gravel and 0 to 5 percent cobbles. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 5/6 or 5YR 4/6, 4/4, 3/6, or 3/4. Moist color is 7.5YR 3/4 or 5YR 3/4 or 4/4. Texture is gravelly clay loam, gravelly loam, loam, or clay loam. The content of clay ranges from 25 to 35 percent. The horizon has 3 to 25

percent gravel and 0 to 5 percent cobbles. Reaction is moderately acid or slightly acid.

Sommeyflat Series

The Sommeyflat series consists of very deep, well drained soils that formed in residuum and colluvium derived from metavolcanic rocks and intrusive igneous rocks, mainly gabbro and quartz diorite. These soils are on side slopes and ridgetops on plutons on Sierra Nevada foothills. Slopes range from 2 to 50 percent. The mean annual precipitation is about 40 inches (1,016 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Sommeyflat loam, on an east-facing slope of 5 percent, under a cover of annual grasses and forbs, at an elevation of 1,950 feet (594 m). When described on 5/29/2002, the soil was dry to a depth of 2 inches (5 cm) and slightly moist from 2 to more than 70 inches (5 to 178 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); strong brown (7.5YR 5/6) loam, dark brown (7.5YR 3/4) moist; 19 percent clay; weak very fine and fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; slightly acid, pH 6.2 by Hellige-Truog; abrupt smooth boundary.

BA—2 to 9 inches (5 to 23 cm); strong brown (7.5YR 4/6) loam, dark brown (7.5YR 3/4) moist; 21 percent clay; weak very fine and fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 2 percent subangular gravel; slightly acid, pH 6.2 by Hellige-Truog; clear smooth boundary.

Bt1—9 to 14 inches (23 to 36 cm); strong brown (7.5YR 5/6) loam, dark brown (7.5YR 3/4) moist; 24 percent clay; moderate fine subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine roots; many very fine and fine and common medium tubular pores; 5 percent patchy distinct clay films on faces of peds; 2 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

Bt2—14 to 24 inches (36 to 61 cm); yellowish red (5YR 4/6) loam, dark reddish brown (5YR 3/4) moist; 26 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; many very fine roots; very fine to medium tubular pores; 10 percent patchy distinct clay films on faces of peds; slightly acid, pH 6.4 by Hellige-Truog; clear wavy boundary.

BCt—24 to 31 inches (61 to 79 cm); yellowish red (5YR 5/6) loam, dark reddish brown (5YR 3/4) moist; 24 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 10 percent patchy distinct clay films on faces of peds; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

C1—31 to 62 inches (79 to 157 cm); brownish yellow (10YR 6/6) loam, dark yellowish brown (10YR 4/6) moist; 19 percent clay; weak very fine and fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; few very fine roots; common very fine and fine tubular pores; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

C2—62 to 70 inches (157 to 178 cm); yellowish brown (10YR 5/6) loam, dark yellowish brown (10YR 4/4) moist; 16 percent clay; weak very fine and fine subangular blocky structure; soft, very friable, nonsticky, slightly plastic; common very fine and fine tubular pores; neutral, pH 6.9 by Hellige-Truog.

Type location: Butte County, California; about 2.2 miles north of Rackerby, approximately 900 feet north and 1,150 feet west of the southeast corner of sec. 30, T. 19 N., R. 6 E.; 39 degrees, 28 minutes, 15.60 seconds north latitude and 121 degrees, 20 minutes, 15.97 seconds west longitude; NAD83; USGS Quad: Rackerby, California.

Range in Characteristics

The depth to paralithic bedrock is 60 to 80 inches or more (152 to 203 cm). The mean annual soil temperature is 59 to 63 degrees F (16 to 17 degrees C). The soil moisture control section is dry in all parts from about June through October (about 165 days). The particle-size control section averages 22 to 29 percent clay and 2 to 15 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 2 percent gravel. Some pedons have a BAt horizon.

The A horizon has dry color of 7.5YR 4/4, 4/6, or 5/6 or 10YR 4/4 or 6/3. Moist color is 7.5YR 3/3, 3/4, or 4/6 or 10YR 3/3 or 3/4. Texture is loam or gravelly loam. The content of clay ranges from 15 to 20 percent. The content of gravel is 0 to 20 percent. By sum of cations, base saturation ranges from 50 to 70 percent. The content of organic matter is 4 to 8 percent. Reaction is slightly acid or neutral.

The BA horizon has dry color of 7.5YR 4/6 or 5/6, 10YR 4/4 or 6/3, or 5YR 4/6. Moist color is 7.5YR 3/4, 5YR 3/4, or 10YR 3/3. Texture is loam or gravelly loam. The content of clay ranges from 14 to 21 percent. The horizon has 0 to 20 percent gravel and 0 to 5 percent cobbles. By sum of cations, base saturation ranges from 45 to 65 percent. The content of organic matter is 1 to 4 percent. Reaction is slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 4/4, 4/6, 5/6, or 6/4; 5YR 4/6; or 2.5YR 5/6. Moist color is 7.5YR 3/4, 5YR 4/4, or 2.5YR 4/6. Texture is loam or clay loam. The content of clay ranges from 18 to 30 percent. The content of gravel is 0 to 10 percent. By sum of cations, base saturation ranges from 55 to 74 percent. The content of organic matter is 0.4 to 1.5 percent. Reaction is slightly acid.

The lower part of the Bt horizon has dry color of 7.5YR 4/6, 5/6, or 6/4; 5YR 4/6, 5/6, or 6/4; or 2.5YR 4/6. Moist color is 7.5YR 3/4, 4/3, 4/4, or 4/6; 5YR 3/4, 4/4, or 4/6; or 2.5YR 4/4. Texture is loam, clay loam, or gravelly clay loam. The content of clay ranges from 22 to 33 percent. The content of gravel is 0 to 15 percent, and the content of cobbles is 0 to 2 percent. By sum of cations, base saturation ranges from 75 to 85 percent. The content of organic matter is 0.2 to 1.0 percent. Reaction is slightly acid or neutral.

The BCt horizon has dry color of 7.5YR 5/8 or 6/8; 10YR 5/3, 5/4, or 6/4; 5YR 5/6; or 2.5YR 5/6. Moist color is 7.5YR 4/6 or 5/6; 10YR 3/4, 4/3, 4/4, or 5/4; 5YR 3/4; or 2.5YR 4/6. Texture is loam or clay loam. The content of clay ranges from 18 to 30 percent. The content of gravel is 0 to 10 percent. The content of organic matter is 0 to 0.5 percent. Reaction is slightly acid.

The C horizon has dry color of 7.5YR 6/6 or 10YR 5/6 or 6/6. Moist color is 7.5YR 4/6 or 10YR 4/4 or 4/6. Texture is loam or gravelly fine sandy loam. The content of clay ranges from 16 to 22 percent. The content of gravel is 0 to 25 percent. Reaction is slightly acid or neutral.

Spine Series

The Spine series consists of shallow, well drained soils that formed in residuum and colluvium derived from metasedimentary and metavolcanic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 64 inches (1,626 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, mesic Lithic Haploxerults

Typical Pedon

Spine very gravelly loam, on a north-facing slope of 35 percent, under a cover of tanoak, sugar pine, Douglas-fir, and whiteleaf manzanita, at an elevation of 3,240 feet (988 m). When described on 7/15/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 3 inches (3 to 8 cm); pink (7.5YR 7/3) very gravelly loam, brown (7.5YR 5/3) moist; 20 percent clay; moderate fine and medium granular structure; soft, very friable, slightly sticky, slightly plastic; common very fine to medium roots; common fine and medium tubular and many very fine irregular and tubular pores; 5 percent cobbles and 30 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.0; clear smooth boundary.

Bt1—3 to 9 inches (8 to 23 cm); pink (7.5YR 8/4) extremely gravelly loam, reddish yellow (7.5YR 6/6) moist; 27 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine to medium and few coarse roots; many very fine to medium tubular pores; 70 percent distinct clay films; 5 percent cobbles and 60 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.2; clear smooth boundary.

Bt2—9 to 16 inches (23 to 41 cm); reddish yellow (7.5YR 7/6) extremely gravelly clay loam, reddish yellow (7.5YR 6/6) moist; 29 percent clay; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky, slightly plastic; common very fine to medium roots; common very fine and fine tubular pores; 30 percent continuous distinct clay films; 5 percent cobbles and 70 percent gravel; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 9.2; gradual wavy boundary.

R—16 inches (41 cm); indurated metasedimentary bedrock; few very fine to medium roots.

Type location: Butte County, California; about 2.2 miles northeast of Sawmill Peak, approximately 1,700 feet north and 1,600 feet west of the southeast corner of sec. 21, T. 23 N., R. 4 E.; 39 degrees, 50 minutes, 5 seconds north latitude and 121 degrees, 31 minutes, 40 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to lithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 50 to 57 degrees F (10 to 14 degrees C). The particle-size control section averages 17 to 35 percent clay and 35 to 75 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 20 to 60 percent gravel, 0 to 20 percent cobbles, 0 to 15 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 10YR 6/3, 6/4, or 7/4 or 7.5YR 6/4 or 7/3. Moist color is 7.5YR 3/3, 4/3, 4/4, 4/6, 5/3, or 5/4 or 10YR 4/3, 4/4, or 5/4. Texture is gravelly loam, very gravelly loam, gravelly sandy loam, or very gravelly sandy loam. The content of clay ranges from 12 to 22 percent. The horizon has 25 to 60 percent gravel and 0 to 5 percent cobbles. Reaction ranges from very strongly acid to slightly acid.

The Bt horizon has dry color of 7.5YR 6/4, 6/6, 7/4, 7/6, or 8/4; 10YR 6/4 or 7/4; or 5YR 5/6. Moist color is 7.5YR 4/3, 4/4, 5/4, 5/6, or 6/6; 10YR 4/4, 5/6, or 5/8; or 5YR 4/4 or 4/6. Texture is gravelly loam, very gravelly loam, extremely gravelly loam, gravelly clay loam, very gravelly clay loam, extremely gravelly clay loam, gravelly sandy loam, or very gravelly sandy loam. The content of clay ranges from 15 to 35 percent. The horizon has 30 to 70 percent gravel and 0 to 15 percent cobbles. Reaction ranges from very strongly acid to slightly acid.

Spine Taxadjunct

The Spine taxadjunct consists of shallow, well drained soils that formed in residuum and colluvium derived from metavolcanic rocks. These soils are on backslopes in metamorphic Sierra Nevada canyons and mountains. Slopes range from 30 to 70 percent. The mean annual precipitation is about 56 inches (1,422 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, mesic Lithic Haploxeralfs

Typical Pedon

Spine taxadjunct very cobbly loam, on a northeast-facing slope of 42 percent, under a cover of Douglas-fir, canyon live oak, California black oak, Pacific madrone, toyon, and manzanita, at an elevation of 1,965 feet (599 m). When described on 11/20/2001, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); reddish yellow (7.5YR 6/6) very cobbly loam, brown (7.5YR 4/4) moist; 25 percent clay; moderate fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to coarse tubular and irregular pores; 20 percent cobbles and 20 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt—2 to 15 inches (5 to 38 cm); reddish yellow (7.5YR 6/6) very cobbly clay loam, reddish brown (5YR 4/4) moist; 30 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to coarse and common very coarse roots; many very fine to coarse tubular and irregular pores; 70 percent continuous distinct clay films; 20 percent gravel and 30 percent cobbles; slightly acid, pH 6.4 by Hellige-Truog; abrupt wavy boundary.

R—15 inches (38 cm); indurated metavolcanic bedrock.

Type location: Butte County, California; about 0.68 mile east of Jarbo Gap, approximately 1,200 feet south and 600 feet east of the northwest corner of sec. 25, T. 22 N., R. 4 E.; 39 degrees, 44 minutes, 15 seconds north latitude and 121 degrees, 29 minutes, 3 seconds west longitude; NAD83; USGS Quad: Berry Creek, California.

Range in Characteristics

The depth to bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 53 to 59 degrees F. The soil moisture control section is dry in all parts from about June to October (about 150 days). The particle-size control section averages 20 to 35 percent clay and 35 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 25 to 80 percent gravel, 5 to 30 percent cobbles, 0 to 20 percent stones, and 0 to 20 percent boulders.

The A horizon has dry color of 7.5YR 6/6 or 7/6 or 5YR 5/4 or 6/4. Moist color is 7.5YR 4/3 or 4/4 or 5YR 3/3 or 4/3. Texture is gravelly loam, very gravelly loam, extremely gravelly loam, cobbly loam, very cobbly loam, extremely cobbly loam, or stony loam. The content of clay ranges from 18 to 27 percent. The horizon has 15 to 60 percent gravel, 10 to 35 percent cobbles, 0 to 20 percent stones, and 0 to 15 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 6/6 or 5YR 6/6. Moist color is 5YR 4/3, 4/4, or 4/6. Texture is very gravelly loam, extremely gravelly loam, very cobbly loam, extremely cobbly loam, very gravelly clay loam, extremely gravelly clay loam, very cobbly clay loam, extremely cobbly clay loam, very stony loam, very stony clay loam, extremely stony loam, or extremely stony clay loam. The content of clay ranges from 22 to 35 percent. The horizon has 15 to 60 percent gravel, 20 to 40 percent cobbles,

0 to 30 percent stones, and 0 to 15 percent boulders. Reaction is slightly acid or neutral.

The Spine taxadjunct is a taxadjunct because the base saturation, by sum of cations, is more than 35 percent, which is higher than is defined as the range for the series. The main limitation is the shallow depth to bedrock. This difference does not significantly affect the use, management, or interpretations of the soils.

Stagpoint Series

The Stagpoint series consists of very deep, well drained soils that formed in tephra-influenced colluvium and residuum derived from metamorphic rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 78 inches (1,981 mm), and the mean annual air temperature is about 49 degrees F (9 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, frigid Andic Haplohumults

Typical Pedon

Stagpoint loam, on a west-facing slope of 12 percent, under a cover of white fir, red fir, and shrubs, at an elevation of 5,325 feet (1,623 m). When described on 7/29/1997, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); needles and twigs.

A—0.5 inch to 4 inches (1 to 10 cm); brown (7.5YR 5/4) loam, dark brown (7.5YR 3/3) moist; 16 percent clay; weak fine subangular blocky structure parting to single grain; loose, very friable, nonsticky, nonplastic; common very fine roots; many very fine irregular pores; 10 percent gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.8; abrupt smooth boundary.

Bt1—4 to 10 inches (10 to 25 cm); light brown (7.5YR 6/4) gravelly loam, dark brown (7.5YR 3/3) moist; 14 percent clay; weak medium subangular blocky structure parting to single grain; slightly hard, very friable, nonsticky, slightly plastic; common very fine to medium roots; common very fine tubular pores; few faint discontinuous clay films between sand grains; 18 percent gravel; moderately acid, pH 5.7 by Hellige-Truog; NaF pH 10.9; abrupt smooth boundary.

Bt2—10 to 17 inches (25 to 43 cm); pink (7.5YR 7/4) very gravelly loam, brown (7.5YR 4/4) moist; 20 percent clay; weak medium subangular blocky structure parting to single grain; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium and few coarse roots; few very fine tubular pores; few faint discontinuous clay films between sand grains; 30 percent gravel and 15 percent cobbles; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 10.3; clear smooth boundary.

2Bt3—17 to 23 inches (43 to 58 cm); yellow (10YR 7/6) very gravelly loam, yellowish brown (10YR 5/6) moist; 22 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few fine to coarse roots; common very fine and few medium tubular pores; few distinct discontinuous clay films in pores; 40 percent gravel and 15 percent cobbles; strongly acid, pH 5.3 by Hellige-Truog; NaF pH 9.6; gradual smooth boundary.

2Bt4—23 to 34 inches (58 to 86 cm); very pale brown (10YR 7/4) extremely cobbly loam, yellowish brown (10YR 5/6) moist; 18 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine to coarse roots; common very fine and few medium tubular pores; few distinct discontinuous clay films in pores; 30 percent gravel, 40 percent cobbles, and 5 percent stones; strongly acid, pH 5.2 by Hellige-Truog; NaF pH 9.4; gradual wavy boundary.

2BCt1—34 to 49 inches (86 to 124 cm); light red (2.5YR 7/6) extremely cobbly loam, reddish brown (2.5YR 5/4) moist; 16 percent clay; weak fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine to coarse roots; common very fine tubular pores; few distinct discontinuous clay films in pores; 10 percent gravel, 50 percent cobbles, and 5 percent stones; strongly acid, pH 5.2 by Hellige-Truog; NaF pH 9.3; gradual wavy boundary.

2BCt2—49 to 64 inches (124 to 163 cm); light reddish brown (2.5YR 7/4) extremely stony loam, light reddish brown (2.5YR 6/4) moist; 16 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few fine and medium roots; common fine and medium tubular pores; few distinct discontinuous clay films in root channels and/or pores; 10 percent cobbles and 50 percent stones; strongly acid, pH 5.2 by Hellige-Truog; NaF pH 9.2; gradual wavy boundary.

2C—64 to 86 inches (163 to 218 cm); pink (2.5YR 8/3) very stony loam, light red (2.5YR 7/6) moist; 9 percent clay; massive; slightly hard, friable, slightly sticky, slightly plastic; 10 percent cobbles and 30 percent stones; strongly acid, pH 5.2 by Hellige-Truog; NaF pH 9.3.

Type location: Plumas County, California; about 2 miles east of Camel Peak Lookout, approximately 300 feet west and 2,550 feet south of the northeast corner of sec. 34, T. 22 N., R. 8 E.; 39 degrees, 43 minutes, 22.5 seconds north latitude and 121 degrees, 3 minutes, 55.8 seconds west longitude; NAD83; USGS Quad: American House, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 40 to 47 degrees F (4 to 8 degrees C). The soil moisture control section is dry in all parts from about August to October (about 60 days). The particle-size control section averages 20 to 23 percent clay and 41 to 58 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. The content of organic matter is 8 to 17 percent to a depth of 10 inches (25 cm), 2 to 5 percent from 10 to 23 inches (25 to 58 cm), 1 to 2 percent from 23 to 64 inches (58 to 163 cm), and less than 1 percent from 64 to 85 inches (163 to 216 cm). By sum of cations, base saturation ranges from 10 to 25 percent from 0.5 inch to 17 inches (1.27 to 43 cm) and is less than 10 percent from 17 to 85 inches (43 to 216 cm). Rock fragments on the surface range from 0 to 5 percent gravel, 0 to 10 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. In some pedons the 2BCt horizon and/or the 2C horizon do not occur.

The A horizon has dry color of 7.5YR 4/2, 4/3, 5/3, 5/4, or 6/4 or 10YR 4/3. Moist color is 7.5YR 3/2, 3/3, 4/3, or 4/4 or 5YR 2/2 or 3/2. Texture is loam, sandy loam, gravelly sandy loam, very gravelly sandy loam, or cobbly sandy loam. The content of clay ranges from 8 to 18 percent. The horizon has 5 to 35 percent gravel and 0 to 15 percent cobbles. NaF pH is 10.5 to 11.5. Acid oxalate extractable Al plus ½ Fe ranges from 1.4 to 2.0. P retention ranges from 80 to 85. The content of glass ranges from 5 to 10 percent. Reaction ranges from slightly acid to strongly acid.

The Bt horizon has dry color of 7.5YR 5/3, 5/4, 6/3, 6/4, 7/4, or 7/6. Moist color is 7.5YR 3/2, 3/3, 3/4, 4/2, 4/3, 4/4, 5/3, or 5/6 or 5YR 4/4. Texture is gravelly loam, gravelly sandy loam, very gravelly loam, very gravelly fine sandy loam, or very gravelly sandy loam. The content of clay ranges from 10 to 25 percent. The horizon has 10 to 40 percent gravel and 0 to 15 percent cobbles. NaF pH is 10.5 to 11.5. Acid oxalate extractable Al plus ½ Fe ranges from 1.0 to 1.8. P retention ranges from 65 to 85. The content of glass ranges from 2 to 10 percent. Reaction ranges from slightly acid to strongly acid.

The 2Bt horizon has dry color of 7.5YR 5/4, 5/6, 6/4, 6/6, 7/4, or 7/6; 5YR 4/6, 5/4, or 5/6; 2.5YR 7/6; or 10YR 6/4, 7/4, 7/6, or 8/4. Moist color is 7.5YR 3/4, 4/3, 4/4, 5/4,

5/6, 5/8, or 6/6; 5YR 4/6 or 5/4; or 10YR 4/3, 5/6, 6/6, or 7/6. Texture is very gravelly loam, very gravelly sandy loam, very gravelly fine sandy loam, very gravelly sandy clay loam, extremely gravelly loam, extremely gravelly coarse sandy loam, extremely gravelly sandy clay loam, very cobbly loam, very cobbly sandy clay loam, very cobbly clay loam, extremely cobbly loam, extremely cobbly sandy clay loam, very stony loam, or very stony clay loam. The content of clay ranges from 15 to 32 percent. The horizon has 10 to 70 percent gravel, 5 to 50 percent cobbles, and 0 to 30 percent stones. NaF pH is 9.3 to 10.5. Acid oxalate extractable Al plus ½ Fe is less than 1. P retention is less than 60. Reaction ranges from slightly acid to very strongly acid.

The 2BCt horizon has dry color of 7.5YR 8/6, 2.5YR 7/4, 10YR 7/4 or 7/6, or 2.5Y 6/2, 8/1, 8/3, or 8/4. Moist color is 7.5YR 5/6 or 6/3, 2.5YR 6/4, 10YR 6/6, or 2.5Y 6/6, 7/3, 7/4, or 7/6. Texture is very stony loam, extremely cobbly loam, extremely stony loam, or extremely gravelly coarse sandy loam. The content of clay ranges from 12 to 18 percent. The horizon has 0 to 80 percent gravel, 5 to 50 percent cobbles, and 5 to 50 percent stones. NaF pH is 9.0 to 9.5. Reaction ranges from moderately acid to very strongly acid.

The 2C horizon has dry color of 2.5YR 8/3 or 10YR 7/6. Moist color is 2.5YR 7/6 or 10YR 5/6. Texture is very stony loam, extremely gravelly coarse sandy loam, extremely gravelly sandy loam, or very gravelly fine sandy loam. The content of clay ranges from 9 to 15 percent. The horizon has 0 to 80 percent gravel, 5 to 10 percent cobbles, and 30 to 50 percent stones. NaF pH is 9.0 to 9.5. Reaction ranges from moderately acid to very strongly acid.

Subaco Taxadjunct

The Subaco taxadjunct consists of moderately deep, poorly drained soils that formed in clayey alluvium derived from mixed rock sources. These soils are on basin rims. Slopes range from 0 to 2 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Aquic Durixererts

Typical Pedon

Subaco taxadjunct clay, on a slope of less than 1 percent, under a cover of annual grasses, at an elevation of 69 feet (21 m). When described on 10/27/1988, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 8 inches (0 to 20 cm); dark gray (10YR 4/1) clay, very dark gray (10YR 2/1) moist; 54 percent clay; strong coarse prismatic structure parting to strong fine and medium granular; very hard, firm, very sticky, very plastic; common very fine roots; many very fine tubular and irregular pores; moderately alkaline, pH 8.0 by pH meter 1:1 water; clear smooth boundary.

Bss—8 to 16 inches (20 to 41 cm); dark gray (10YR 4/1) silty clay, very dark gray (10YR 3/1) moist; 55 percent clay; strong coarse prismatic structure parting to strong medium angular blocky; extremely hard, very firm, very sticky, very plastic; common very fine roots; many very fine tubular and irregular pores; 3 percent slickensides; strongly alkaline, pH 8.7 by pH meter 1:1 water; clear smooth boundary.

Bkss—16 to 29 inches (41 to 74 cm); dark gray (10YR 4/1) silty clay; very dark gray (10YR 3/1) moist; 55 percent clay; strong coarse prismatic structure parting to strong medium angular blocky; extremely hard, very firm, very sticky, very plastic; few very fine roots; many very fine tubular and irregular pores; 3 percent slickensides; strongly effervescent; 3 percent fine irregular carbonate masses; strongly alkaline, pH 9.0 by pH meter 1:1 water; abrupt wavy boundary.

Bk—29 to 35 inches (74 to 89 cm); light brownish gray (10YR 6/2) clay, grayish brown (10YR 5/2) moist; 50 percent clay; moderate medium subangular blocky structure; very hard, very firm, very sticky, very plastic; few very fine roots; many very fine tubular and irregular pores; finely disseminated carbonates throughout; strongly effervescent; very strongly alkaline, pH 9.2 by pH meter 1:1 water; abrupt wavy boundary.

2Bkqm—35 to 42 inches (89 to 107 cm); indurated duripan, dark grayish brown (2.Y 4/2) moist; silty clay loam; 32 percent clay; strongly effervescent; strongly alkaline, pH 8.8 by pH meter 1:1 water; indurated, silica- and lime-laminated capping 1 cm thick; abrupt smooth boundary.

2Cd—42 inches (107 cm); densic material; sandy loam; 7 percent clay; moderately alkaline, pH 8.3 by pH meter 1:1 water.

Type location: Butte County, California; about 1.1 miles northwest of Pennington, approximately 1,200 feet north and 200 feet west of the southeast corner of sec. 24, T. 17 N., R. 1 E.; 39 degrees, 18 minutes, 26 seconds north latitude and 121 degrees, 47 minutes, 52 seconds west longitude; NAD27; USGS Quad: Pennington, California.

Range in Characteristics

Depth to the duripan ranges from 20 to 40 inches (51 to 102 cm). Depth to dense material ranges from 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from about June to October (120 to 125 days) when the soils are not irrigated. The particle-size control section averages 40 to 60 percent clay. Mineralogy is smectitic. The content of organic matter is 1 to 3 percent to a depth of 29 inches (74 cm) and is less than 1 percent from 29 to 35 inches (74 to 89 cm). The depth to carbonates ranges from 0 to 25 inches (0 to 64 cm). Electrical conductivity ranges from less than 1 mmho to 4 mmhos per cm throughout the profile. Surface-initiated, reversible cracks 0.75 inch to 2 inches (1.9 to 5 cm) wide extend to a depth of 29 inches (74 cm) or more or to the 2Bkqm horizon. The cracks remain open from June to October (150 to 180 days) in nonirrigated areas and are closed the rest of the year. A fluctuating water table can occur between the top of the duripan and 18 to 40 inches (46 to 102 cm) below the surface of the soil from December through April.

The A horizon has dry color of 10YR 3/1 or 4/1. Moist color is 10YR 2/1 or 3/1. The content of clay ranges from 45 to 55 percent. The content of exchangeable sodium is 0 to 2 percent. SAR is 0 to 2. Reaction is slightly alkaline or moderately alkaline.

The Bss horizon has dry color of 10YR 3/1, 4/1, or 5/1. Moist color is 10YR 3/1 or 4/1. Texture is silty clay or clay. The content of clay ranges from 50 to 60 percent. The content of exchangeable sodium is 2 to 3 percent. SAR is 2 to 3. Reaction ranges from slightly alkaline to strongly alkaline.

The Bkss horizon has dry color of 10YR 4/1, 5/1, 6/1, or 7/1. Moist color is 10YR 3/1, 4/1, or 5/1. Texture is silty clay or clay. The content of clay ranges from 50 to 60 percent. This horizon is slightly effervescent to strongly effervescent. The content of exchangeable sodium is 3 to 12 percent. SAR is 3 to 7. Reaction is moderately alkaline or strongly alkaline.

The Bk horizon has dry color of 10YR 6/2, 7/2, or 8/2. Moist color is 10YR 5/2 or 6/2. Texture is clay loam or clay. The content of clay ranges from 35 to 60 percent. This horizon is strongly effervescent or violently effervescent. The content of exchangeable sodium is 10 to 13 percent. SAR is 5 to 10. The content of calcium carbonate ranges from 15 to 20 percent. Reaction is strongly alkaline or very strongly alkaline.

Reaction in the 2Bkqm horizon ranges from slightly alkaline to strongly alkaline.

The Subaco taxadjunct is a taxadjunct because it has a duripan and a calcic horizon, whereas the Subaco series typically has a paralithic contact of siltstone. This

difference does not significantly affect the use, management, or interpretations of the soils.

Sunnyslope Series

The Sunnyslope series consists of shallow, well drained soils that formed in residuum derived from metavolcanic rocks, mainly greenschist. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada foothills. Slopes range from 2 to 15 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic, shallow Ultic Haploxeralfs

Typical Pedon

Sunnyslope loam, on a north-facing slope of 7 percent, under a cover of blue oak, wild oat, rattlesnake brome, Italian ryegrass, red clover, dandelion, and wild onion, at an elevation of 215 feet (65 m). When described on 7/30/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); strong brown (7.5YR 5/6) loam, dark brown (7.5YR 3/3) moist; 17 percent clay; moderate very fine and fine subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; many very fine roots; common fine and many very fine tubular pores; 2 percent subangular quartz gravel and 10 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); strong brown (7.5YR 5/6) gravelly loam, dark reddish brown (5YR 3/4) moist; 20 percent clay; strong fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; many very fine roots; common fine and many very fine tubular pores; 4 percent patchy faint clay films on faces of peds; 15 percent subangular gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual wavy boundary.

Bt2—6 to 10 inches (15 to 25 cm); yellowish red (5YR 4/6) very cobbly loam, reddish brown (5YR 4/4) moist; 25 percent clay; strong fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; common fine and many very fine roots; few fine and many very fine tubular pores; 25 percent patchy faint clay films on faces of peds; 35 percent subangular gravel and 25 percent subangular cobbles; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

Bt3—10 to 14 inches (25 to 36 cm); yellowish red (5YR 4/6) extremely gravelly clay loam, reddish brown (5YR 4/4) moist; 29 percent clay; strong very fine and fine subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; few medium and common very fine roots; few fine and many very fine tubular pores; 25 percent patchy faint clay films on faces of peds; 70 percent subangular gravel; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

Crt—14 to 21 inches (36 to 53 cm); yellowish red (5YR 5/8), moderately cemented greenschist bedrock, yellowish red (5YR 4/6) moist; few very fine, fine, and coarse roots on top of the horizon; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Butte County, California; about 4 miles southeast of Palermo, approximately 600 feet north and 1,250 feet east of the southwest corner of sec. 22, T. 18 N., R. 4 E.; 39 degrees, 23 minutes, 47.10 seconds north latitude and 121 degrees, 30 minutes, 57.59 seconds west longitude; NAD83; USGS Quad: Palermo, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June 1 to October 15 (about 150 days). The particle-size control section averages 15 to 25 percent clay and 35 to 50 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent stones.

The A horizon has dry color of 7.5YR 4/6, 5/4, or 5/6. Moist color is 7.5YR 3/3 or 3/4. Texture is loam. The content of clay ranges from 10 to 18 percent. The content of gravel is 2 to 12 percent. The content of organic matter is 3 to 7 percent. By sum of cations, base saturation ranges from 65 to 75 percent. Reaction is slightly acid.

The upper part of the Bt horizon has dry color of 7.5YR 5/6 or 6/4 or 5YR 5/6. Moist color is 7.5YR 4/4 or 5YR 3/4. Texture is loam, gravelly loam, or very gravelly loam. The content of clay ranges from 15 to 20 percent. The content of gravel is 15 to 35 percent. The content of organic matter is 1 to 4 percent. By sum of cations, base saturation ranges from 65 to 75 percent. Reaction is moderately acid or slightly acid.

The lower part of the Bt horizon has dry color of 5YR 4/6 or 5/6 or 7.5YR 5/4. Moist color is 5YR 4/3 or 4/4. Texture is very gravelly loam, extremely gravelly loam, very cobbly loam, or extremely gravelly clay loam. The content of clay ranges from 15 to 30 percent. The content of gravel is 35 to 70 percent, and the content of cobbles is 0 to 25 percent. By sum of cations, base saturation ranges from 65 to 75 percent. The content of organic matter is 0.5 to 2 percent. Reaction is moderately acid or slightly acid.

Surnuf Series

The Surnuf series consists of very deep, well drained soils that formed in residuum and colluvium derived from metamorphic and intrusive igneous rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 70 percent. The mean annual precipitation is about 52 inches (1,321 mm), and the mean annual air temperature is about 56 degrees F (13 degrees C).

Taxonomic class: Fine, parasesquic, mesic Ultic Palexeralfs

Typical Pedon

Surnuf gravelly loam, on a northwest-facing slope of 37 percent, under a cover of Douglas-fir, ponderosa pine, and California black oak, at an elevation of 2,040 feet (622 m). When described on 9/27/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 4 inches (3 to 10 cm); reddish yellow (5YR 7/6) gravelly loam, yellowish red (5YR 4/6) moist; 26 percent clay; strong fine and medium granular structure; moderately hard, very friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to medium irregular and tubular pores; 30 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear wavy boundary.

Bt1—4 to 9 inches (10 to 23 cm); reddish yellow (5YR 7/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 31 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, moderately sticky, moderately plastic; many very fine to medium roots; many very fine and fine and common medium irregular and tubular pores; 90 percent continuous distinct clay films on faces of peds; 25 percent gravel; neutral, pH 6.8 by Hellige-Truog; gradual smooth boundary.

Bt2—9 to 16 inches (23 to 41 cm); reddish yellow (5YR 7/6) gravelly clay loam, red (2.5YR 4/6) moist; 35 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, moderately sticky, moderately plastic; few coarse and many very fine to medium roots; many very fine to medium tubular pores; 90 percent continuous distinct clay films on faces of peds; 20 percent gravel; neutral, pH 6.8 by Hellige-Truog; gradual smooth boundary.

Bt3—16 to 27 inches (41 to 69 cm); light red (2.5YR 6/8) gravelly clay, red (2.5YR 5/6) moist; 42 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, moderately sticky, moderately plastic; few coarse and many very fine to medium roots; many very fine to medium tubular pores; 95 percent continuous distinct clay films on faces of peds; 20 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt4—27 to 29 inches (69 to 74 cm); light red (2.5YR 6/8) gravelly clay, red (2.5YR 4/8) moist; 50 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; few coarse and common very fine to medium roots; many very fine and fine and common medium tubular and irregular pores; 95 percent continuous distinct clay films on faces of peds; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt5—29 to 56 inches (74 to 142 cm); light red (2.5YR 6/8) gravelly silty clay, red (2.5YR 4/8) moist; 55 percent clay; strong fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; few coarse and common very fine to medium roots; many very fine and fine and common medium tubular and irregular pores; 99 percent continuous prominent clay films on faces of peds; 20 percent gravel; slightly acid, pH 6.4 by Hellige-Truog; gradual smooth boundary.

Bt6—56 to 72 inches (142 to 183 cm); light red (2.5YR 6/8) silty clay, red (2.5YR 4/8) moist; 50 percent clay; strong fine and medium angular blocky structure; very hard, friable, moderately sticky, moderately plastic; few very fine to coarse roots; common very fine and fine and few medium tubular and irregular pores; 99 percent continuous prominent clay films on faces of peds; 10 percent gravel; slightly acid, pH 6.4 by Hellige-Truog.

Type location: Butte County, California; about 0.2 mile west of the intersection of Pinkston Canyon Road and Highway 70, approximately 300 feet south and 450 feet west of the northeast corner of sec. 34, T. 22 N., R. 4 E.; 39 degrees, 43 minutes, 32 seconds north latitude and 121 degrees, 30 minutes, 24 seconds west longitude; NAD83; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 59 degrees F (11 to 15 degrees C). The particle-size control section averages 35 to 45 percent clay and 10 to 35 percent rock fragments, mostly gravel. Mineralogy is parasesquic. Rock fragments on the surface range from 0 to 30 percent gravel, 0 to 10 percent cobbles, and 0 to 2 percent stones.

The A horizon has dry color of 7.5YR 6/4, 6/6, or 7/4 or 5YR 5/4, 6/4, or 7/6. Moist color is 7.5YR 4/3 or 4/4 or 5YR 3/3, 4/3, 4/4, or 4/6. Texture is gravelly loam, gravelly clay loam, clay loam, or loam. The content of clay ranges from 22 to 30 percent. The horizon has 5 to 30 percent gravel and 0 to 5 percent cobbles. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 7.5YR 6/4 or 6/6; 5YR 5/4, 5/6, 6/6, or 7/6; or 2.5YR 4/6, 5/4, 6/6, or 7/6. Moist color is 7.5YR 4/4 or 4/6; 5YR 4/3, 4/4, 4/6, 5/6, or 5/8; or 2.5YR 4/4 or 4/6. Texture is clay loam or gravelly clay loam. The content of clay ranges from 27 to 40 percent. The content of gravel is 0 to 25 percent, and the content of cobbles is 0 to 10 percent. Reaction is slightly acid or neutral.

The middle part of the Bt horizon has dry color of 7.5YR 6/6, 5YR 5/6 or 6/6, or 2.5YR 3/6, 4/8, 6/6, 6/8, or 7/6. Moist color is 5YR 4/6, 5/6, or 5/8 or 2.5YR 4/6, 5/6, or 4/8. Texture is clay, gravelly clay, cobbly clay, gravelly clay loam, or very cobbly clay loam. The content of clay ranges from 35 to 55 percent. The content of gravel is 0 to 30 percent, the content of cobbles is 0 to 25 percent, and the content of stones is 0 to 5 percent. Reaction is slightly acid or neutral.

The lower part of the Bt horizon has dry color of 5YR 6/6 or 6/8 or 2.5YR 4/4, 5/6, 6/6, 7/6, 4/8, or 6/8. Moist color is 5YR 5/6 or 5/8; 2.5YR 3/4, 4/6, 4/8, 5/6, or 5/8; or 7.5YR 5/6 or 6/8. Texture is clay, gravelly clay, cobbly clay, stony clay, very cobbly clay, extremely cobbly clay, silty clay, gravelly silty clay, very gravelly silty clay loam, gravelly clay loam, very gravelly clay loam, or extremely gravelly clay loam. The content of clay ranges from 35 to 55 percent. The content of gravel is 10 to 50 percent, the content of cobbles is 0 to 30 percent, and the content of stones is 0 to 25 percent. Reaction ranges from moderately acid to neutral.

Surnuf Taxadjunct

The Surnuf taxadjunct consists of very deep, well drained soils that formed in residuum and colluvium derived from metavolcanic rocks. These soils are on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 52 inches (1,321 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Fine, parasesquic, mesic Ultic Haploxeralfs

Typical Pedon

Surnuf taxadjunct loam, on a northeast-facing slope of 26 percent, under a cover of mixed conifers, hardwoods, and shrubs, at an elevation of 1,845 feet (562 m). When described on 8/9/2000, the soil was dry to a depth of 18 inches (46 cm) and slightly moist from 18 to 67 inches (46 to 170 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 2 cm); slightly decomposed plant material

A—1 to 5 inches (2 to 13 cm); reddish brown (5YR 5/4) loam, dark reddish brown (5YR 3/4) moist; 25 percent clay; strong fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine roots; many very fine irregular pores; 10 percent greenstone schist gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.0; abrupt smooth boundary.

Bt1—5 to 11 inches (13 to 28 cm); red (2.5YR 5/6) clay loam, red (2.5YR 4/6) moist; 38 percent clay; moderate medium subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common fine and medium and few very fine roots; common fine and many very fine tubular pores; 20 percent discontinuous distinct clay films on surfaces along pores; 10 percent greenstone schist gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.0; abrupt smooth boundary.

Bt2—11 to 18 inches (28 to 46 cm); red (2.5YR 5/6) silty clay, red (2.5YR 4/6) moist; 50 percent clay; strong medium angular blocky structure; hard, very firm, very sticky, very plastic; few very fine and fine and common medium and coarse roots; few fine and common very fine tubular pores; 50 percent continuous prominent clay films on surfaces along pores; 5 percent greenstone schist gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 9.5; gradual smooth boundary.

Bt3—18 to 31 inches (46 to 79 cm); red (2.5YR 5/8) silty clay, red (2.5YR 4/8) moist; 55 percent clay; strong medium angular blocky structure; hard, very firm, very sticky, very plastic; few fine, common medium, and few coarse roots; few fine and common very fine tubular pores; 60 percent continuous prominent clay films on

surfaces along pores; 5 percent greenstone schist gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.5; gradual smooth boundary.

Bt4—31 to 43 inches (79 to 109 cm); red (2.5YR 5/8) silty clay, red (2.5YR 4/8) moist; 45 percent clay; strong medium angular blocky structure; hard, friable, very sticky, very plastic; few fine to coarse roots; common very fine tubular pores; 80 percent continuous prominent clay films on surfaces along pores; 5 percent greenstone schist gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt5—43 to 54 inches (109 to 137 cm); red (2.5YR 5/8) very stony silty clay loam, red (2.5YR 4/8) moist; 38 percent clay; moderate fine angular blocky structure; hard, friable, very sticky, very plastic; few fine and common medium and coarse roots; common very fine tubular pores; 80 percent continuous prominent clay films on surfaces along pores; 5 percent greenstone schist gravel and 50 percent greenstone schist stones; strongly acid, pH 5.5 by Hellige-Truog; gradual smooth boundary.

BCt—54 to 67 inches (137 to 170 cm); 30 percent reddish yellow (5YR 6/8) and 70 percent red (2.5YR 5/6) silty clay loam, 70 percent red (2.5YR 4/6) and 30 percent yellowish red (5YR 5/6) moist; 33 percent clay; moderate fine subangular blocky structure; hard, friable, slightly sticky, moderately plastic; few fine roots; common very fine tubular pores; 80 percent continuous prominent clay films on surfaces along pores; 5 percent greenstone schist gravel; very strongly acid, pH 5.0 by Hellige-Truog.

Type location: Butte County, California; about 1.1 miles northwest of Bloomer Hill Lookout, approximately 1,700 feet west and 1,600 feet south of the northeast corner of sec. 24, T. 21 N., R. 4 E.; 39 degrees, 39 minutes, 54 seconds north latitude and 121 degrees, 28 minutes, 28 seconds west longitude; NAD83; USGS Quad: Berry Creek, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 53 to 59 degrees F (12 to 15 degrees C). The particle-size control section averages 48 percent clay and 1 percent rock fragments, mostly gravel. Mineralogy is mixed. NaF pH is 9.0 to 9.5 to a depth of 31 inches (79 cm). Rock fragments on the surface range from 0 to 10 percent gravel, 0 to 20 percent cobbles, 0 to 15 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 5YR 5/4, 5/6, or 6/4 or 7.5YR 6/4. Moist color is 5YR 3/3, 3/4, or 3/6 or 2.5YR 4/4. Texture is loam. The content of clay ranges from 20 to 25 percent. The horizon has 5 to 10 percent gravel, 0 to 30 percent cobbles, and 0 to 30 percent stones. The content of organic matter is 5 to 8 percent. By sum of cations, base saturation ranges from 50 to 55 percent. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 2.5YR 5/6 or 5YR 4/6 or 6/6. Moist color is 2.5YR 3/3, 3/6, 4/4, or 4/6 or 5YR 4/6. Texture is clay loam, gravelly clay loam, very gravelly clay loam, gravelly loam, or silty clay loam. The content of clay ranges from 22 to 40 percent. The content of gravel is 0 to 40 percent, the content of cobbles is 0 to 10 percent, and the content of stones is 0 to 30 percent. The content of organic matter is 3 to 6 percent. By sum of cations, base saturation ranges from 50 to 55 percent. Reaction ranges from strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 2.5YR 4/8, 5/6, 5/8, or 6/6; 5YR 6/6 or 6/8; or 7.5YR 5/8. Moist color is 2.5YR 3/6, 4/6, 4/8, or 5/6; 5YR 5/8; 7.5YR 5/6; or 10R 4/6. Texture is silty clay, clay, silty clay loam, gravelly clay, gravelly silty clay, extremely bouldery silty clay, extremely cobbly silty clay, or very stony silty clay loam. The content of clay ranges from 35 to 65 percent. The content of gravel is 0 to 25 percent, the content of cobbles is 0 to 60 percent, the content of stones is 0 to 50 percent, and the content of boulders is 0 to 60 percent. The content of organic matter

is 1.0 to 3.0 percent. By sum of cations, base saturation ranges from 50 to 65 percent. Reaction ranges from very strongly acid to slightly acid.

The BCt horizon has dry color of 5YR 5/6 or 5/8, 2.5YR 5/6 or 6/8, or 7.5YR 6/6. Moist color is 5YR 5/6, 2.5YR 4/6 or 5/6, or 7.5YR 4/6 or 6/8. Texture is silty clay loam, silt loam, gravelly sandy clay loam, or very gravelly sandy clay loam. The content of clay ranges from 25 to 35 percent. The horizon has 0 to 40 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 0.5 to 1 percent. By sum of cations, base saturation ranges from 50 to 65 percent. Reaction ranges from very strongly acid to moderately acid.

The Surnuf taxadjunct is a taxadjunct because the content of clay at a depth of 60 inches (150 cm) decreases by more than 20 percent. This difference does not significantly affect the use, management, or interpretations of the soils.

Swedesflat Series

The Swedesflat series consists of shallow, well drained soils that formed in residuum derived from intrusive igneous rocks, mainly quartz diorite. These soils are on ridgetops and side slopes on plutons on Sierra Nevada foothills. Slopes range from 2 to 30 percent. The mean annual precipitation is about 35 inches (889 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Loamy, mixed, active, thermic, shallow Ultic Haploxeralfs

Typical Pedon

Swedesflat cobbly fine sandy loam, on a northeast-facing slope of 10 percent, under a cover of annual grasses, forbs, blue oak, and scattered foothill pine, whiteleaf manzanita, buckbrush, and Pacific poison oak, at an elevation of 1,450 feet (442 m). When described on 8/9/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); very pale brown (10YR 7/4) cobbly fine sandy loam, yellowish brown (10YR 5/4) moist; 14 percent clay; weak very fine and fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many very fine roots; many very fine to medium tubular pores; 10 percent subangular gravel and 15 percent subangular cobbles; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

ABt—2 to 8 inches (5 to 20 cm); light yellowish brown (10YR 6/4) cobbly sandy loam, yellowish brown (10YR 5/4) moist; 14 percent clay; weak fine subangular blocky structure; soft, very friable, nonsticky, nonplastic; many fine roots; many very fine to medium tubular pores; 3 percent patchy faint clay films on surfaces along pores and 3 percent patchy faint clay films on surfaces along root channels; 2 percent fine spherical reddish yellow (5YR 6/8) oxidized iron masses; 10 percent subangular gravel and 15 percent subangular cobbles; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bt—8 to 12 inches (20 to 30 cm); strong brown (7.5YR 5/6) sandy loam, strong brown (7.5YR 4/6) moist; 18 percent clay; moderate fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; few very fine roots; many very fine to medium tubular pores; 7 percent patchy faint clay films on faces of peds; 5 percent subangular gravel; moderately acid, pH 6.1 by Hellige-Truog; clear wavy boundary.

Crt—12 to 18 inches (30 to 46 cm); weakly cemented quartz diorite bedrock; few fine roots; 40 percent clay films in fractures; clear wavy boundary.

Cr—18 inches (46 cm); weakly cemented quartz diorite bedrock; few fine roots on top of the horizon.

Type location: Butte County, California; about 1.5 miles west of Hurleton, approximately 500 feet south and 1,600 feet west of the northeast corner of sec. 21, T. 19 N., R. 5 E.; 39 degrees, 29 minutes, 48 seconds north latitude and 121 degrees, 24 minutes, 46 seconds west longitude; NAD83; USGS Quad: Bangor, California.

Range in Characteristics

The depth to paralithic bedrock is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 59 to 63 degrees F (16 to 17 degrees C). The soil moisture control section is dry in all parts from about June through October (about 165 days). The particle-size control section averages 15 to 25 percent clay, 4 to 25 percent gravel, and 0 to 5 percent cobbles. Mineralogy is mixed. Rock fragments on the surface range from 0 to 3 percent stones.

The A horizon has dry color of 10YR 5/3 or 7/4 or 7.5YR 4/4, 4/6, or 5/4. Moist color is 10YR 3/4 or 5/4 or 7.5YR 3/4 or 4/4. Texture is loam, gravelly loam, sandy loam, gravelly sandy loam, fine sandy loam, or cobbly fine sandy loam. The content of clay ranges from 12 to 20 percent. The horizon has 2 to 30 percent gravel and 0 to 15 percent cobbles. By sum of cations, base saturation ranges from 50 to 70 percent. The content of organic matter is 2 to 8 percent. Reaction ranges from strongly acid to neutral.

The ABt horizon has dry color of 10YR 6/4 or 7.5YR 5/4, 5/6, or 6/4. Moist color is 10YR 5/4 or 7.5YR 4/4 or 4/6. Texture is loam, gravelly loam, sandy loam, gravelly sandy loam, or cobbly sandy loam. The content of clay ranges from 13 to 20 percent. The horizon has 5 to 35 percent gravel and 0 to 15 percent cobbles. By sum of cations, base saturation ranges from 40 to 60 percent. The content of organic matter is 1.5 to 3 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 10YR 5/3 or 5/4, 7.5YR 5/4 or 5/6, or 5YR 5/8. Moist color is 7.5YR 3/4, 4/4, or 4/6 or 5YR 4/6. Texture is gravelly loam, sandy loam, gravelly fine sandy loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 18 to 25 percent. The content of gravel is 0 to 30 percent. By sum of cations, base saturation ranges from 40 to 74 percent. The content of organic matter is 0.2 to 1.5 percent. Reaction ranges from moderately acid to neutral.

Thermalito Series

The Thermalito series consists of moderately deep, somewhat poorly drained soils that formed in alluvium derived from metamorphic and igneous rocks. These soils are on mounds on intermediate terraces. Slopes range from 0 to 9 percent. The mean annual precipitation is about 24 inches (610 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Abruptic Durixeralfs

Typical Pedon

Thermalito sandy loam, on a 3 slope of percent, under a cover of annual grasses and forbs, at an elevation of 161 feet (49 m). When described on 4/17/1997, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 5/4) sandy loam, dark reddish brown (5YR 3/4) moist; 15 percent clay; moderate thin platy structure parting to moderate fine subangular blocky; slightly hard, very friable, nonsticky, nonplastic; common very fine roots; few very fine tubular pores; 5 percent fine irregular strong brown (7.5YR 4/6) oxidized iron masses; 10 percent well rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); light brown (7.5YR 6/4) gravelly sandy loam, reddish brown (5YR 4/4) moist; 20 percent clay; moderate medium subangular blocky

structure; hard, friable, nonsticky, nonplastic; common very fine roots; few very fine tubular pores; 20 percent discontinuous distinct clay films on faces of peds; 2 percent fine irregular black (N 2/0) manganese masses and 5 percent fine irregular strong brown (7.5YR 4/6) oxidized iron masses; 20 percent well rounded gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

Bt2—6 to 12 inches (15 to 30 cm); light brown (7.5YR 6/4) sandy clay loam, reddish brown (5YR 4/4) moist; 24 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine roots; few fine and common very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds; 10 percent well rounded gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

Bt3—12 to 18 inches (30 to 46 cm); reddish yellow (7.5YR 6/6) gravelly sandy clay loam, reddish brown (5YR 4/4) moist; 28 percent clay; moderate medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; few fine and common very fine tubular pores; 50 percent discontinuous distinct clay films on faces of peds; 25 percent well rounded gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

Bt4—18 to 23 inches (46 to 58 cm); light brown (7.5YR 6/4) gravelly sandy clay loam, reddish brown (5YR 5/4) moist; 30 percent clay; moderate fine subangular blocky structure; hard, firm, slightly sticky, slightly plastic; few very fine roots; few fine and common very fine tubular pores; 50 percent discontinuous distinct clay films on faces of peds; 25 percent well rounded gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

Bt5—23 to 25 inches (58 to 63 cm); reddish yellow (5YR 6/6) gravelly sandy clay loam, yellowish red (5YR 4/6) moist; 33 percent clay; moderate fine subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few very fine roots; few fine tubular pores; 50 percent discontinuous distinct clay films on faces of peds; 20 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

2Bt6—25 to 29 inches (63 to 74 cm); red (2.5YR 5/6) gravelly clay, red (2.5YR 4/6) moist; 50 percent clay; moderate fine angular blocky structure; extremely hard, very firm, very sticky, moderately plastic; few very fine roots; few very fine tubular pores; 55 percent discontinuous distinct clay films on faces of peds; 25 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

2Bt7—29 to 32 inches (74 to 81 cm); yellowish red (5YR 5/6) gravelly clay, red (2.5YR 4/6) moist; 45 percent clay; moderate fine angular blocky structure; extremely hard, very firm, very sticky, moderately plastic; few very fine roots; few very fine tubular pores; 55 percent discontinuous distinct clay films on faces of peds; 2 percent fine irregular black (N 2/0) manganese masses; 30 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

3Bqm—32 to 60 inches (81 to 152 cm); indurated duripan; cemented by silica; 30 percent well rounded gravel.

Type location: Butte County, California; about 3.8 miles west of Oroville, approximately 1,600 feet west and 650 feet south of the northeast corner of sec. 16, T. 19 N., R. 3 E.; 39 degrees, 30 minutes, 28 seconds north latitude and 121 degrees, 38 minutes, 15 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

Depth to an indurated gravelly duripan is 20 to 40 inches (51 to 102 cm), and depth to the 2Bt horizon is 18 to 25 inches (46 to 63 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 24 to 35 percent clay and 2 to 30 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur from the top of the

duripan to 14 inches (36 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 0 to 20 percent gravel.

The A horizon has dry color of 7.5YR 5/4, 5/6, 6/4, 6/6, or 7/3 or 10YR 6/4 or 7/3. Moist color is 5YR 3/4, 4/4, or 4/6; 7.5YR 3/3, 4/3, or 5/4; or 10YR 3/4. Texture is sandy loam, gravelly sandy loam, fine sandy loam, or loam. The content of clay ranges from 12 to 20 percent. The content of gravel is 2 to 25 percent. The content of organic matter is 0.5 to 2 percent. Redoximorphic features range from 2 to 25 percent soft oxidized iron masses. Reaction ranges from strongly acid to slightly acid.

The Bt horizon has dry color of 7.5YR 5/6, 6/4, 6/6, or 7/4 or 5YR 5/6, 6/4, or 6/6. Moist color is 7.5YR 3/4, 4/4, or 4/6 or 5YR 3/4, 4/4, 4/6, or 5/4. Texture is gravelly sandy loam, sandy clay loam, gravelly sandy clay loam, loam, or clay loam. The content of clay ranges from 18 to 33 percent. The content of gravel is 5 to 30 percent. The content of organic matter is 0.1 to 0.5 percent. Redoximorphic features range from 0 to 5 percent soft oxidized iron masses and 0 to 2 percent soft manganese masses. Reaction ranges from strongly acid to neutral.

The 2Bt horizon has dry color of 2.5YR 5/6; 5YR 5/6, 6/4, or 6/6; or 7.5YR 5/4 or 6/6. Moist color is 2.5YR 4/6 or 5YR 4/4, 4/6, or 5/4. Texture is gravelly clay, clay, sandy clay, or silty clay. The content of clay ranges from 43 to 50 percent. The content of gravel is 2 to 30 percent. The content of organic matter is 0 to 0.5 percent. Redoximorphic features range from 0 to 2 percent soft manganese masses. Reaction ranges from moderately acid to neutral.

The 3Bqm horizon is indurated to weakly cemented, becoming less cemented with increasing depth, and may have a silica and manganese capping up to 1/8 inch (3 mm) thick. The content of gravel is 10 to 50 percent. Redoximorphic features range from 10 to 90 percent manganese surface coatings on the upper surface.

Thermalrocks Series

The Thermalrocks series consists of very shallow, well drained soils that formed in residuum weathered from basalt. These soils are on the top of basalt plateaus on volcanic Sierra Nevada foothills. Slopes range from 2 to 30 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Lithic Haplohumults

Typical Pedon

Thermalrocks very gravelly loam, on a northwest-facing slope of 2 percent, under a cover of annual grasses and forbs, at an elevation of 970 feet (296 m). When described on 5/17/2001, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); brown (10YR 5/3) very gravelly loam, dark brown (7.5YR 3/2) moist; 16 percent clay; weak thin platy structure parting to moderate fine granular; soft, friable, slightly sticky, nonplastic; many very fine and fine roots; many fine irregular pores; 15 percent subangular basalt cobbles and 20 percent subangular basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; clear wavy boundary.

Bt—1 to 5 inches (3 to 13 cm); brown (10YR 5/3) very gravelly loam, dark brown (7.5YR 3/2) moist; 20 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; common fine irregular pores; 10 percent discontinuous faint clay films on surfaces along pores; 15 percent subangular basalt cobbles and 45 percent subangular basalt gravel; very strongly acid, pH 5.0 by Hellige-Truog; abrupt irregular boundary.

R—5 inches (13 cm); indurated basalt bedrock.

Type location: Butte County, California; about 2.6 miles north of Oroville, approximately 1,000 feet south and 2,800 feet east of the northwest corner of sec. 31, T. 20 N., R. 4 E.; 39 degrees, 33 minutes, 06.55 seconds north latitude and 121 degrees, 34 minutes, 01.19 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The depth to lithic bedrock is 5 to 10 inches (8 to 25 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about April to November (about 150 to 200 days). The particle-size control section averages 18 to 27 percent clay and 35 to 55 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. By sum of cations, base saturation ranges from 4 to 7 percent. Rock fragments on the surface range from 0 to 60 percent gravel, 0 to 50 percent cobbles, and 0 to 10 percent stones. Some pedons are cobbly, very cobbly, or gravelly silt loam throughout.

The A horizon has dry color of 10YR 3/3, 4/3, 4/4, or 5/3. Moist color is 7.5YR 2/2, 3/2, or 3/3 or 10YR 2/2, 3/2, or 3/3. Texture is cobbly loam, very gravelly loam, gravelly loam, loam, extremely gravelly loam, or very cobbly loam. The content of clay ranges from 14 to 18 percent. The horizon has 10 to 65 percent gravel and 5 to 40 percent cobbles. The content of organic matter is 4 to 8 percent. Reaction ranges from very strongly acid to slightly acid.

The Bt horizon has dry color of 10YR 3/3, 3/4, 4/4, 5/3, or 5/4 or 7.5YR 4/4. Moist color is 7.5YR 3/2, 3/4, or 4/2 or 10YR 2/2, 3/2, 3/3, or 4/2. Texture is very gravelly loam, very cobbly loam, very cobbly clay loam, extremely cobbly loam, or extremely gravelly loam. The content of clay ranges from 18 to 28 percent. The horizon has 10 to 90 percent gravel and 15 to 50 percent cobbles. The content of organic matter is 1.5 to 5 percent. Reaction ranges from very strongly acid to moderately acid.

Thompsonflat Series

The Thompsonflat series consists of very deep, moderately well drained soils that formed in alluvium derived from metamorphic and igneous rocks. These soils are on intermediate and high terraces. Slopes range from 0 to 30 percent. The mean annual precipitation is about 24 inches (610 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Ultic Haploxeralfs

Typical Pedon

Thompsonflat fine sandy loam, on a southeast-facing slope of 5 percent, under a cover of annual grasses, forbs, interior live oak, foothill pine, toyon, and redbud, at an elevation of 270 feet (82 m). When described on 9/26/2000, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (7.5YR 5/4) fine sandy loam, dark brown (7.5YR 3/3) moist; 15 percent clay; moderate medium platy structure parting to moderate fine subangular blocky; slightly hard, friable, nonsticky, nonplastic; common very fine roots; common fine irregular and few very fine tubular pores; 10 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt1—3 to 7 inches (8 to 18 cm); reddish brown (5YR 5/4) fine sandy loam, dark reddish brown (5YR 3/4) moist; 20 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; few very fine to medium

roots; common very fine tubular pores; 15 percent discontinuous distinct clay films on faces of peds; 5 percent well rounded gravel; moderately acid, pH 6.0 by Hellige-Truog; abrupt smooth boundary.

Bt2—7 to 11 inches (18 to 28 cm); yellowish red (5YR 5/6) sandy clay loam, reddish brown (2.5YR 4/4) moist; 28 percent clay; moderate fine subangular blocky structure; hard, firm, slightly sticky, slightly plastic; few fine and medium roots; common very fine tubular pores; 25 percent discontinuous distinct clay films on faces of peds; 5 percent well rounded gravel and 5 percent well rounded cobbles; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bt3—11 to 15 inches (28 to 38 cm); yellowish red (5YR 4/6) sandy clay, dark reddish brown (2.5YR 3/4) moist; 38 percent clay; moderate fine subangular blocky structure; hard, very firm, moderately sticky, moderately plastic; few fine roots; common very fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds; 5 percent well rounded cobbles and 10 percent well rounded gravel; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

2Bt4—15 to 22 inches (38 to 56 cm); brown (7.5YR 5/4) gravelly sandy clay, brown (7.5YR 4/3) moist; 43 percent clay; weak fine subangular blocky structure; hard, very firm, moderately sticky, very plastic; few fine roots; common very fine tubular pores; 50 percent discontinuous distinct clay films on faces of peds; 5 percent well rounded cobbles and 25 percent well rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

3Btq1—22 to 35 inches (56 to 89 cm); reddish yellow (7.5YR 6/6) extremely gravelly sandy clay loam, strong brown (7.5YR 5/6) moist; 25 percent clay; weak very fine subangular blocky structure parting to single grain; noncemented, hard, firm, slightly sticky, slightly plastic; few fine roots; few very fine tubular pores; 10 percent discontinuous distinct clay films on rock fragments and 20 percent patchy distinct clay bridges on the upper faces of peds; 10 percent silica on rock fragments and on faces of peds; 15 percent well rounded cobbles and 55 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

3Btq2—35 to 45 inches (89 to 114 cm); reddish yellow (7.5YR 6/6) extremely gravelly coarse sandy loam, strong brown (7.5YR 5/6) moist; 12 percent clay; weak very fine subangular blocky structure parting to single grain; noncemented, hard, firm, nonsticky, nonplastic; few fine roots; few very fine tubular pores; 10 percent discontinuous distinct clay films on rock fragments and 40 percent patchy distinct clay bridges on the upper faces of peds; 10 percent silica on rock fragments and faces of peds; 25 percent well rounded cobbles and 55 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

3Btq3—45 to 53 inches (114 to 135 cm); reddish yellow (7.5YR 6/6) extremely gravelly coarse sandy loam, strong brown (7.5YR 4/6) moist; 5 percent clay; weak very fine subangular blocky structure parting to single grain; noncemented, hard, firm, nonsticky, nonplastic; few fine roots; few very fine tubular pores; 10 percent patchy distinct clay bridges on the upper faces of peds and 10 percent discontinuous distinct clay films on rock fragments; 15 percent silica on rock fragments and faces of peds; 5 percent fine irregular black (N 2/0) manganese masses; 20 percent well rounded cobbles and 45 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

3Btq4—53 to 66 inches (135 to 168 cm); reddish yellow (7.5YR 6/6) extremely gravelly coarse sandy loam, strong brown (7.5YR 4/6) moist; 5 percent clay; weak very fine subangular blocky structure parting to single grain; noncemented, hard, firm, nonsticky, nonplastic; few fine roots; few very fine tubular pores; 10 percent patchy distinct clay bridges on the upper faces of peds and 10 percent discontinuous distinct clay films on rock fragments; 15 percent silica between sand grains and on rock fragments; 5 percent fine irregular black (N 2/0)

manganese masses; 2 percent well rounded cobbles and 70 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

3Btq5—66 to 80 inches (168 to 203 cm); reddish yellow (7.5YR 6/6) extremely gravelly coarse sandy loam, strong brown (7.5YR 5/6) moist; 5 percent clay; weak very fine subangular blocky structure parting to single grain; noncemented, hard, firm, nonsticky, nonplastic; few fine roots; few very fine tubular pores; 10 percent patchy distinct clay bridges on the upper faces of peds and 10 percent discontinuous distinct clay films on rock fragments; 15 percent silica between sand grains and on rock fragments; 5 percent fine irregular black (N 2/0) manganese masses; 15 percent well rounded cobbles and 70 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 0.5 mile north of downtown Oroville, approximately 3,350 feet east and 1,800 feet south of the northeast corner of projected sec. 8, T. 19 N., R. 4 E.; 39 degrees, 31 minutes, 14 seconds north latitude and 121 degrees, 33 minutes, 6 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

The thickness of the solum is more than 80 inches (203 cm), depth to the 3Btq horizon is 22 to 75 inches (56 to 190 cm) or more, and depth to 2Bt horizon is 15 to 43 inches (38 to 109 cm). The mean annual soil temperature is 61 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 23 to 34 percent clay and 4 to 34 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur at a depth of 40 to 80 inches (102 to 203 cm) from December through April. Rock fragments on the surface range from 0 to 10 percent gravel and 0 to 2 percent cobbles.

The A horizon has dry color of 7.5YR 5/3, 5/4, or 6/4 or 5YR 5/4. Moist color is 7.5YR 3/2, 3/3, 3/4, 4/2, or 4/3 or 5YR 3/3 or 3/4. Texture is fine sandy loam, loam, sandy loam, gravelly fine sandy loam, gravelly sandy loam, gravelly loam, or sandy clay loam. The content of clay ranges from 12 to 22 percent. The content of gravel is 1 to 25 percent. The content of organic matter is 0.5 to 1.2 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 5YR 4/6, 5/4, 5/6, or 6/6 or 7.5YR 5/4 or 6/4. Moist color is 5YR 3/4, 4/4, or 4/6; 2.5YR 3/4, 3/6, 4/4, or 4/6; or 7.5YR 3/4 or 4/4. Texture is fine sandy loam, loam, sandy clay loam, sandy clay, gravelly loam, gravelly sandy loam, gravelly sandy clay loam, or gravelly clay loam. The content of clay ranges from 18 to 38 percent. The horizon has 0 to 25 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 0.1 to 0.5 percent. Reaction ranges from moderately acid to neutral.

The 2Bt horizon has dry color of 7.5YR 5/4, 6/4, or 7/3 or 2.5YR 5/4, 5/6, or 6/6. Moist color is 7.5YR 4/3, 4/4, or 4/6; 5YR 4/6; or 2.5YR 4/4 or 4/6. Texture is gravelly sandy clay, gravelly clay, very gravelly clay, extremely gravelly sandy clay, sandy clay, or clay. The content of clay ranges from 38 to 55 percent. The horizon has 2 to 70 percent gravel and 0 to 10 percent cobbles. The content of organic matter is 0.1 to 0.5 percent. Reaction ranges from moderately acid to moderately alkaline.

The 3Btq horizon has dry color of 7.5YR 5/6, 6/6, or 7/6. Moist color is 7.5YR 4/6 or 5/6. Texture is extremely gravelly sandy clay loam, extremely gravelly coarse sandy loam, gravelly sandy loam, sandy clay loam, or loamy sand. The content of clay ranges from 5 to 38 percent. The horizon has 10 to 70 percent gravel and 0 to 25 percent cobbles. Redoximorphic features range from 0 to 60 percent soft manganese masses and 0 to 2 percent soft oxidized iron masses, noncemented or very weakly cemented. The content of organic matter is 0 to 0.3 percent. Reaction ranges from slightly acid to moderately alkaline.

Timberisland Series

The Timberisland series consists of deep, well drained soils that formed in mixed tephra and colluvium and residuum derived from Lovejoy basalt. These soils are on the benches, tops, and side slopes of basalt ridges on volcanic Sierra Nevada mountains. Slopes range from 0 to 30 percent. The mean annual precipitation is about 80 inches (2,032 mm), and the mean annual air temperature is about 51 degrees F (11 degrees C).

Taxonomic class: Medial-skeletal, ferrihydritic, mesic Humic Haploxerands

Typical Pedon

Timberisland very gravelly medial sandy loam, on a southwest-facing slope of 30 percent, under a cover of mixed conifers, at an elevation of 4,325 feet (1,318 m). When described on 6/20/1995, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1.5 inches (0 to 3 cm); fresh needles, leaves, cones, and twigs.

Oe—1.5 to 3 inches (3 to 8 cm); moderately decomposed litter of needles, leaves, cones, and twigs.

A1—3 to 6 inches (8 to 15 cm); brown (10YR 5/3) very gravelly medial sandy loam, very dark brown (10YR 2/2) moist; 16 percent clay; weak fine subangular blocky structure parting to single grain; loose, very friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine irregular pores; 40 percent subangular basalt gravel; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 9.0; abrupt smooth boundary.

A2—6 to 14 inches (15 to 36 cm); brown (10YR 5/3) very gravelly medial sandy loam, very dark brown (10YR 2/2) moist; 16 percent clay; weak fine subangular blocky structure parting to single grain; loose, very friable, slightly sticky, slightly plastic; many fine, common very fine, and few medium roots; many very fine irregular pores; 40 percent subangular basalt gravel and 5 percent subangular basalt cobbles; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 11.2; abrupt smooth boundary.

Bw1—14 to 25 inches (36 to 64 cm); brown (10YR 5/3) very gravelly medial sandy loam, very dark grayish brown (10YR 3/2) moist; 18 percent clay; weak fine subangular blocky structure; loose, very friable, slightly sticky, slightly plastic; many fine, common very fine, and few medium roots; many very fine irregular pores; 5 percent clay films on rock fragments, on faces of peds, and in pores; 40 percent subangular basalt gravel and 10 percent subangular basalt cobbles; strongly acid, pH 5.5 by Hellige-Truog; NaF pH 11.2; clear smooth boundary.

Bw2—25 to 35 inches (64 to 89 cm); yellowish brown (10YR 5/4) extremely cobbly medial sandy loam, dark brown (10YR 3/3) moist; 12 percent clay; weak fine subangular blocky structure; loose, very friable, nonsticky, slightly plastic; common fine and medium roots; many very fine irregular pores; 35 percent subangular basalt gravel and 35 percent subangular basalt cobbles; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 11.1; gradual wavy boundary.

Bw3—35 to 48 inches (89 to 122 cm); yellowish brown (10YR 5/4) extremely cobbly medial sandy loam, dark brown (10YR 3/3) moist; 12 percent clay; weak fine subangular blocky structure; slightly hard, very friable, nonsticky, slightly plastic; common fine roots; many very fine irregular pores; 10 percent subangular basalt gravel and 80 percent subangular basalt cobbles; moderately acid, pH 5.8 by Hellige-Truog; NaF pH 10.3; abrupt smooth boundary.

R—48 inches (122 cm); indurated basalt; very few roots in fractures more than 12 inches (31 cm) apart.

Type location: Butte County, California; about 2.2 miles northeast of Camp Eighteen, approximately 600 feet west and 1,450 feet north of the southeast corner of sec. 25, T. 21 N., R. 7 E.; 39 degrees, 38 minutes, 48 seconds north latitude and 121 degrees, 8 minutes, 16 seconds west longitude; NAD27; USGS Quad: Cascade, California.

Range in Characteristics

The depth to lithic bedrock is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 10 to 18 percent clay and 40 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is ferrihydritic. Rock fragments on the surface range from 5 to 40 percent gravel, 0 to 25 percent cobbles, 0 to 15 percent stones, and 0 to 5 percent boulders.

The A1 horizon has dry color of 10YR 3/2, 4/2, 4/3, or 5/3. Moist color is 10YR 2/1, 2/2, 3/1, or 3/2; 7.5YR 3/2; or N 2/0. Texture is very gravelly medial sandy loam, gravelly medial sandy loam, medial sandy loam, or gravelly medial coarse sandy loam. The content of clay ranges from 5 to 18 percent. The horizon has 5 to 40 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones. The content of organic matter is 15 to 52 percent. By ammonium acetate, base saturation ranges from 20 to 40 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.0 to 2.5. P retention ranges from 80 to 85. The content of glass ranges from 2 to 5 percent. NaF pH is 9.0 to 10.0. Reaction ranges from strongly acid to slightly acid.

The A2 horizon has dry color of 10YR 3/2, 4/2, 4/3, or 5/3. Moist color is 10YR 2/1, 2/2, 3/1, or 3/2; 7.5YR 3/2; or N 2/0. Texture is medial sandy loam, gravelly medial sandy loam, very gravelly medial sandy loam, or gravelly medial coarse sandy loam. The content of clay ranges from 5 to 18 percent. The horizon has 5 to 40 percent gravel, 0 to 10 percent cobbles, and 0 to 10 percent stones. The content of organic matter is 10 to 20 percent. By ammonium acetate, base saturation ranges from 5 to 10 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.0 to 3.5. P retention ranges from 85 to 95. The content of glass ranges from 2 to 5 percent. NaF pH is 10.0 to 11.5. Reaction ranges from strongly acid to slightly acid.

The Bw1 horizon has dry color of 10YR 4/2, 5/2, or 5/3 or 7.5YR 4/3. Moist color is 10YR 2/1, 3/2, or 3/3 or 7.5YR 4/3. Texture is gravelly medial sandy loam, very gravelly medial sandy loam, or extremely gravelly medial sandy loam. The content of clay ranges from 8 to 18 percent. The horizon has 30 to 40 percent gravel, 0 to 20 percent cobbles, 0 to 10 percent stones, and 0 to 5 percent boulders. The content of organic matter is 10 to 18 percent. By ammonium acetate, base saturation ranges from 2 to 5 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.0 to 3.5. P retention ranges from 85 to 95. The content of glass ranges from 1 to 5 percent. NaF pH is 11 to 11.5. Reaction ranges from strongly acid to slightly acid.

The Bw2 and Bw3 horizons have dry color of 10YR 4/2, 5/2, 5/3, or 5/4; 7.5YR 4/2, 4/3, 4/4, or 5/3; or 2.5Y 5/4. Moist color is 10YR 3/2 or 3/3; 7.5YR 3/2, 3/3, 3/4, or 4/3; or 2.5Y 3/2. Texture is extremely cobbly medial fine sandy loam, extremely cobbly medial sandy loam, extremely gravelly medial sandy loam, or very cobbly medial sandy loam. The content of clay ranges from 10 to 22 percent. The horizons have 10 to 60 percent gravel, 25 to 80 percent cobbles, 0 to 5 percent stones, and 0 to 5 percent boulders. The content of organic matter is 2 to 10 percent. By ammonium acetate, base saturation ranges from 2 to 5 percent. Acid oxalate extractable Al plus 1/2 Fe ranges from 2.0 to 3.5. P retention ranges from 85 to 96. The content of glass ranges from 1 to 5 percent. NaF pH is 10.0 to 11.5. Reaction ranges from very strongly acid to slightly acid.

Toadtown Series

The Toadtown series consists of very deep, well drained soils that formed in weathered tephra over residuum and colluvium derived from metadiorite, metavolcanic rocks, gabbro, or diorite. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 2 to 70 percent. The mean annual precipitation is about 72 inches (1,829 mm), and the mean annual air temperature is about 53 degrees F (12 degrees C).

Taxonomic class: Fine, parasesquic, mesic Andic Haplohumults

Typical Pedon

Toadtown loam, on an east-southeast-facing slope of 7 percent, under a cover of mixed conifers, at an elevation of 3,590 feet (1,094 m). When described on 11/28/1995, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); pine needles.

Oe—2 to 3 inches (5 to 8 cm); partially decomposed forest litter, mostly pine needles.

A—3 to 5 inches (8 to 13 cm); reddish brown (5YR 5/4) loam, reddish brown (5YR 4/3) moist; 26 percent clay; moderate medium subangular blocky structure parting to strong fine granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and common fine roots; many very fine and fine tubular and many medium and common coarse irregular pores; noneffervescent; 12 percent gravel; moderately acid, pH 5.7 by pH meter 1:1 water; NaF pH 10.5; clear smooth boundary.

Bt1—5 to 8 inches (13 to 20 cm); yellowish red (5YR 5/6) loam, reddish brown (5YR 4/4) moist; 27 percent clay; moderate medium subangular blocky structure parting to strong fine granular; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine and many medium roots; many very fine to medium irregular and tubular and common coarse irregular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 14 percent gravel; strongly acid, pH 5.5 by pH meter 1:1 water; NaF pH 10.3; clear smooth boundary.

Bt2—8 to 13 inches (20 to 33 cm); yellowish red (5YR 5/6) clay loam, red (2.5YR 4/6) moist; 29 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and coarse and many fine and medium roots; many very fine to coarse tubular pores; common distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 10 percent gravel; strongly acid, pH 5.4 by pH meter 1:1 water; NaF pH 10.1; clear smooth boundary.

Bt3—13 to 18 inches (33 to 46 cm); reddish yellow (5YR 6/6) clay, red (2.5YR 4/6) moist; 40 percent clay; strong medium subangular blocky structure; moderately hard, firm, slightly sticky, moderately plastic; common very fine and many fine to coarse roots; many very fine to coarse tubular pores; many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 5 percent gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.6; clear smooth boundary.

Bt4—18 to 27 inches (46 to 69 cm); reddish yellow (5YR 6/6) clay, red (2.5YR 5/6) moist; 43 percent clay; strong fine and medium subangular blocky structure; hard, very firm, slightly sticky, moderately plastic; common very fine and coarse and many fine and medium roots; many very fine and fine tubular pores; many distinct continuous clay films on faces of peds and in pores; noneffervescent; 2 percent gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.6; gradual smooth boundary.

Bt5—27 to 51 inches (69 to 130 cm); reddish yellow (5YR 7/6) clay loam, reddish yellow (5YR 6/6) moist; 31 percent clay; strong medium angular blocky structure;

moderately hard, firm, slightly sticky, moderately plastic; common very fine and fine roots; common very fine and fine tubular pores; many distinct continuous and common prominent continuous clay films on faces of peds and in pores; noneffervescent; 1 percent gravel; strongly acid, pH 5.3 by pH meter 1:1 water; NaF pH 9.4; gradual irregular boundary.

Bt6—51 to 65 inches (130 to 165 cm); reddish yellow (5YR 7/6) loam, yellowish red (5YR 5/8) moist; 27 percent clay; moderate medium angular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine tubular pores; many distinct discontinuous and few prominent discontinuous clay films on faces of peds and in pores; noneffervescent; 2 percent gravel; strongly acid, pH 5.3 by pH meter 1:1 water; clear irregular boundary.

Bt7—65 to 75 inches (165 to 190 cm); reddish yellow (5YR 7/6) loam, yellowish red (5YR 5/6) moist; 18 percent clay; weak medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine and fine tubular pores; few prominent discontinuous and many distinct discontinuous clay films on faces of peds and in pores; noneffervescent; 1 percent gravel; strongly acid, pH 5.2 by pH meter 1:1 water; clear wavy boundary.

Crt—75 to 79 inches (190 to 201 cm); reddish yellow (7.5YR 8/6) loam, yellowish red (5YR 5/6) moist; 17 percent clay; massive; slightly sticky, slightly plastic; few very fine and fine roots; common very fine and fine tubular pores; common prominent discontinuous clay films in pores; noneffervescent; 1 percent gravel; strongly acid, pH 5.2 by pH meter 1:1 water.

Type location: Butte County, California; about 1 mile southwest of Powellton, approximately 600 feet north and 1,500 feet west of the southeast corner of sec. 24, T. 24 N., R. 3 E.; 39 degrees, 55 minutes, 0.7 second north latitude and 121 degrees, 34 minutes, 57.98 seconds west longitude; NAD27; USGS Quad: Stirling City, California.

Range in Characteristics

The depth to paralithic bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 54 to 57 degrees F (12 to 14 degrees C). The soil moisture control section is dry in all parts from about July to October (about 90 days). The particle-size control section averages 35 to 45 percent clay and 2 to 5 percent rock fragments, mostly gravel. Mineralogy is parasesquic. Acid oxalate extractable Al plus $^1/_2$ Fe ranges from 1.1 to 1.57 to a depth of 13 inches (33 cm). Rock fragments on the surface range from 0 to 35 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 5YR 4/3, 4/4, 5/4, 5/6, or 6/4; 2.5YR 4/6 or 5/6; or 7.5YR 5/4 or 6/6. Moist color is 5YR 3/3, 4/3, or 4/4; 2.5YR 3/3, 3/4, 3/6, or 4/4; or 7.5YR 3/3. Texture is loam, gravelly loam, sandy loam, gravelly sandy loam, or very gravelly loam. The content of clay ranges from 15 to 27 percent. The content of gravel is 0 to 45 percent. The content of organic matter is 10 to 15 percent. By sum of cations, base saturation ranges from 15 to 25 percent. By ammonium acetate, CEC ranges from 20 to 30. NaF pH is 10 to 11. Reaction is moderately acid or slightly acid.

The upper part of the Bt horizon has dry color of 2.5YR 4/6, 5/6, or 6/6 or 5YR 4/4, 5/4, 5/6, 6/4, or 6/6. Moist color is 2.5YR 3/4, 3/6, 4/4, or 4/6 or 5YR 4/4. Texture is loam, gravelly loam, clay loam, silty clay loam, sandy clay loam, or gravelly clay loam. The content of clay ranges from 23 to 37 percent. The content of gravel is 0 to 20 percent, and the content of cobbles is 0 to 10 percent. The content of organic matter is 3 to 8 percent. By sum of cations, base saturation ranges from 10 to 20 percent. By ammonium acetate, CEC ranges from 12 to 20. NaF pH is 10 to 11. Reaction ranges from strongly acid to slightly acid.

The middle part of the Bt horizon has dry color of 5YR 5/6, 5/8, 6/6, or 7/6 or 2.5YR 4/6, 5/6, 4/8, 5/8, 6/6, or 7/6. Moist color is 2.5YR 3/6, 4/4, 4/6, 4/8, 5/6, or 6/8

or 5YR 5/8. Texture is silty clay, gravelly clay, clay, clay loam, or gravelly clay loam. The content of clay ranges from 35 to 60 percent. The content of gravel is 0 to 30 percent, and the content of cobbles is 0 to 10 percent. The content of organic matter is 0.8 to 3 percent. By sum of cations, base saturation ranges from 10 to 20 percent. By ammonium acetate, CEC ranges from 9 to 12. NaF pH is 9 to 10. Reaction ranges from strongly acid to slightly acid.

The lower part of the Bt horizon has dry color of 2.5YR 4/8, 5/6, or 5/8; 5YR 5/6, 6/6, 6/8, or 7/6; or 7.5YR 5/6, 6/6, 6/8, or 7/6. Moist color is 2.5YR 3/6, 4/6, 4/8, or 5/6; 5YR 4/6, 5/6, 5/8, or 6/6; or 7.5YR 4/6, 5/6, or 5/8. Texture is clay loam, loam, silt loam, silty clay loam, cobbly silty clay loam, cobbly clay loam, gravelly clay loam, or gravelly loam. The content of clay ranges from 18 to 35 percent. The content of gravel is 0 to 30 percent, and the content of cobbles is 0 to 20 percent. The content of organic matter is 0.1 to 0.3 percent. By sum of cations, base saturation ranges from 2 to 10 percent. By ammonium acetate, CEC ranges from 5 to 12. NaF pH is 9 to 10. Reaction ranges from strongly acid to slightly acid.

Trainer Series

The Trainer series consists of very deep, somewhat poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are on stream terraces. Slopes are 0 to 1 percent. The mean annual precipitation is about 20 inches (508 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Fine-loamy, mixed, active, thermic Aquic Haploxerepts

Typical Pedon

Trainer loam, on a slope of less than 1 percent, in a fallow rice paddy, at an elevation of 85 feet (26 m). When described on 4/4/1985, the soil was moist throughout. (Colors are for dry soil unless otherwise noted).

Ap—0 to 4 inches (0 to 10 cm); yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; weak medium granular structure; very hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; few very fine and fine tubular pores and common very fine and fine interstitial pores; slightly acid, pH 6.5; clear smooth boundary.

A—4 to 9 inches (10 to 23 cm); yellowish brown (10YR 5/4) loam, dark yellowish brown (10YR 3/4) moist; weak medium granular structure; very hard, friable, slightly sticky, slightly plastic; few very fine roots; few very fine and fine tubular and interstitial pores; common fine distinct dark reddish brown (5YR 3/4), few coarse prominent very dark grayish brown (2.5Y 3/2), and few medium prominent grayish brown (10YR 5/2) and brown (10YR 5/3) oxidized iron masses along root channels; few fine black (10YR 2/1) iron-manganese masses and concretions; slightly alkaline, pH 7.5; clear wavy boundary.

Bt1—9 to 16 inches (23 to 41 cm); brown (7.5YR 5/4) loam, brown (7.5YR 4/4) moist; weak medium subangular blocky structure; very hard, very friable, slightly sticky, slightly plastic; few very fine roots; few very fine and coarse tubular pores; few thin clay films in pores; few fine and medium black (10YR 2/1) iron-manganese masses and concretions; slightly alkaline, pH 7.8; clear smooth boundary.

Bt2—16 to 23 inches (41 to 58 cm); brown (7.5YR 5/4) loam, brown (7.5YR 4/4) moist; weak medium subangular blocky structure; very hard, very friable, slightly sticky, slightly plastic; few very fine tubular pores; few thin clay films in pores and bridging sand grains; few fine and medium black (10YR 2/1) iron-manganese masses; moderately alkaline, pH 8.0; gradual smooth boundary.

Bt3—23 to 36 inches (58 to 91 cm); very pale brown (10YR 7/4) sandy loam, yellowish brown (10YR 5/4) moist; weak medium subangular blocky structure; very hard, very friable, slightly sticky, slightly plastic; few very fine tubular pores; common thin clay films in pores and bridging sand grains; common fine distinct brown (7.5YR 4/4) oxidized iron masses; few fine and medium black (10YR 2/1) iron-manganese masses and concretions; moderately alkaline, pH 8.0; gradual smooth boundary.

BCt—36 to 48 inches (91 to 122 cm); reddish yellow (7.5YR 6/6) sandy loam, brown (7.5YR 4/4) moist; massive; slightly hard and very friable, nonsticky, nonplastic; few very fine tubular pores; few thin clay films bridging sand grains; common medium grayish brown (10YR 5/2) bleached sand coatings on faces of peds; few fine and medium black (10YR 2/1) iron-manganese masses and concretions; moderately alkaline, pH 8.0; clear smooth boundary.

C1—48 to 59 inches (122 to 150 cm); reddish yellow (7.5YR 6/6) sandy loam, strong brown (7.5YR 5/6) moist; massive; slightly hard, very friable, nonsticky, nonplastic; moderately alkaline, pH 8.0; abrupt smooth boundary.

C2—59 to 66 inches (150 to 168 cm); reddish yellow (7.5YR 6/6) coarse sandy loam, strong brown (7.5YR 4/6) moist; massive; slightly hard, very friable, nonsticky, nonplastic; moderately alkaline, pH 8.0.

Type location: Yuba County, California; about 4.5 miles northeast of Marysville on Highway 20 to Loma Rica Road, approximately 600 feet west and 1,150 feet north of the southeast corner of sec. 22, T. 16 N., R. 4 E.; 39 degrees, 13 minutes, 29 seconds north latitude and 121 degrees, 30 minutes, 10 seconds west longitude; NAD27; USGS Quad: Yuba City, California.

Range in Characteristics

The mean annual soil temperature is 64 to 66 degrees F (18 to 19 degrees C). The soil temperature is above 47 degrees F (8 degrees C) the entire year. Unless the soils are irrigated, the soil moisture control section is dry in all parts from May 15 through October 31 and is moist in some or all parts from November 1 through May 15. A fluctuating water table can occur at a depth of 36 and 60 inches (91 to 152 cm) from January through December. Reaction ranges from slightly acid to moderately alkaline. Some pedons have a Bw horizon.

The A horizon has dry color of 10YR 5/4, 5/3, 4/4, or 4/3 or 7.5YR 5/4, 4/4, or 4/3. Moist color is 10YR 3/4, 3/3, or 3/2 or 7.5YR 3/3. Texture is loam or sandy clay loam. The content of clay ranges from 18 to 27 percent.

The Bt or Bw horizon has dry color of 10YR 7/4 or 4/3 or 7.5YR 7/4, 6/4, 5/4, 4/4, 4/3, or 6/6. Moist color is 10YR 5/4 or 3/3 or 7.5YR 5/6, 5/4, 4/4, 3/4, 3/3, or 4/6. Texture is sandy loam, loam, or sandy clay loam. The content of clay ranges from 18 to 27 percent.

The C horizon has dry color of 7.5YR 5/4, 3/4, or 6/6 or 10YR 4/4. Moist color is 7.5YR 3/4, 4/3, 4/4, 4/6, or 5/6. Texture is sandy loam, coarse sandy loam, loam, or fine sandy loam. The content of clay ranges from 10 to 18 percent.

Tuscan Series

The Tuscan series consists of shallow, somewhat poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are on strath terraces on Cascade foothills and on fan terraces. Slopes range from 0 to 3 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Clayey, mixed, superactive, thermic, shallow Typic Durixeralfs

Typical Pedon

Tuscan gravelly loam, on a south-facing slope of 1 percent, under a cover of filaree, spike rush, and clover, at an elevation of 207 feet (63 m). When described on 3/29/2000, the soil was dry to a depth of 1.5 inches (4 cm), very slightly moist from 1.5 to 11 inches (4 to 28 cm), and dry below 11 inches (28 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 4 cm); very pale brown (10YR 7/3) gravelly loam, brown (10YR 4/3) moist; 27 percent clay; moderate thin and medium platy structure parting to moderate fine subangular blocky; very hard, friable, moderately sticky, moderately plastic; many very fine roots; few very fine and fine irregular and tubular pores; 20 percent medium threadlike strong brown (7.5YR 5/6 dry) oxidized iron masses lining pores; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 4 inches (4 to 11 cm); brown (7.5YR 5/3) clay loam, brown (7.5YR 4/3) moist; 34 percent clay; moderate thick platy structure parting to moderate coarse and medium subangular blocky; extremely hard, friable, moderately sticky, moderately plastic; common very fine roots; few fine and very fine tubular pores; 80 percent continuous distinct clay films; 10 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt2—4 to 7 inches (11 to 19 cm); brown (7.5YR 5/3) gravelly clay, brown (7.5YR 4/3) moist; 40 percent clay; moderate medium and fine subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine roots; few fine and very fine tubular pores; 80 percent continuous distinct clay films; 5 percent cobbles and 10 percent gravel; neutral, pH 7.2 by Hellige-Truog; gradual smooth boundary.

Bt3—7 to 11 inches (19 to 28 cm); brown (7.5YR 5/3) cobbly clay, brown (7.5YR 4/3) moist; 50 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine roots; few fine and very fine tubular pores; 80 percent continuous distinct clay films; 15 percent cobbles and 15 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt smooth boundary.

2Bqm—11 inches (28 cm); very strongly cemented duripan; cemented by silica; 20 percent manganese coatings at the top of the horizon; 40 percent cobbles and 40 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog.

Type location: Butte County, California; about 0.875 mile east-southeast of the Durham-Pentz Road/Highway 99 overpass, approximately 550 feet north and 2,100 feet west of the southeast corner of sec. 25, T. 21 N., R. 2 E.; 39 degrees, 38 minutes, 26 seconds north latitude and 121 degrees, 41 minutes, 53 seconds west longitude; NAD27; USGS Quad: Hamlin Canyon, California.

Range in Characteristics

Depth to the duripan is 10 to 20 inches (925 to 51 cm). The duripan is underlain by volcanic sandstone or volcanic sediments. The mean annual soil temperature is 62 to 65 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 150 days). The particle-size control section averages 35 to 55 percent clay and 15 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 2 inches (5 cm) below the surface of the soil from November through March. Redoximorphic features occur as oxidized iron masses in the A horizon, iron-manganese masses in the A and Bt horizons, iron-manganese concretions in the Bt horizon, and a manganese capping on the 2Bqm horizon. Rock fragments on the surface range from 0 to 25 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 5/4, 6/3, 6/4, or 7/3 or 10YR 5/3, 6/3, or 7/3. Moist color is 10YR 4/2 or 4/3, 7.5YR 4/3, or 5YR 3/3. Texture is loam, gravelly loam, or sandy clay loam. The content of clay ranges from 20 to 27 percent. The content of gravel is 5 to 25 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 4/3, 5/3, 5/4, 5/6, 6/4, 6/6, or 7/4; 5YR 4/3, 4/4, 5/3, or 5/4; or 10YR 5/3. Moist color is 7.5YR 4/3, 4/4, or 5/3; 5YR 3/3, 4/3, or 4/4; or 10YR 4/3. Texture is clay loam, gravelly clay loam, very gravelly clay loam, very cobbly clay loam, clay, gravelly clay, very gravelly clay, extremely gravelly clay, or cobbly clay. The content of clay ranges from 30 to 55 percent. The horizon has 5 to 50 percent gravel and 0 to 25 percent cobbles. Reaction is neutral or slightly alkaline.

Tuscan Taxadjunct

The Tuscan taxadjunct consists of moderately deep, somewhat poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are on mounds on fan terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine, mixed, superactive, thermic Typic Durixeralfs

Typical Pedon

Tuscan taxadjunct gravelly clay loam, on a south-facing slope of 1 percent, under a cover of filaree, soft chess, and goldfields, at an elevation of 275 feet (84 m). When described on 4/2/1997, the soil was slightly moist from a depth of 2 to 29 inches (5 to 74 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 4 cm); brown (7.5YR 4/2) gravelly clay loam, dark reddish brown (5YR 3/2) moist; 30 percent clay; moderate thick platy structure parting to strong thin and medium platy and then to strong fine subangular blocky; hard, slightly sticky, moderately plastic; many very fine roots; common very fine vesicular and tubular pores; 10 percent fine irregular iron-manganese masses and 15 percent fine and medium threadlike strong brown (7.5YR 5/6) oxidized iron masses between peds; 15 percent volcanic gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 5 inches (4 to 13 cm); dark reddish gray (5YR 4/2) gravelly clay, dark reddish brown (5YR 3/2) moist; 40 percent clay; strong coarse prismatic structure parting to strong coarse angular blocky; very hard, firm, moderately sticky, very plastic; many very fine roots between peds; common very fine vesicular and tubular pores; 80 percent continuous prominent clay films on faces of peds; 5 percent fine irregular iron-manganese masses between peds; 15 percent volcanic gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bt2—5 to 13 inches (13 to 33 cm); dark reddish gray (5YR 4/2) gravelly clay, dark reddish brown (5YR 3/3) moist; 40 percent clay; moderate coarse prismatic structure parting to moderate medium subangular blocky; very hard, firm, moderately sticky, very plastic; common very fine roots; few very fine vesicular and tubular pores; 80 percent continuous prominent clay films on faces of peds; 15 percent volcanic gravel; slightly alkaline, pH 7.8 by Hellige-Truog; gradual wavy boundary.

Bt3—13 to 23 inches (33 to 58 cm); brown (7.5YR 5/3) gravelly clay loam, reddish brown (5YR 4/3) moist; 38 percent clay; moderate medium subangular blocky structure; very hard, friable, moderately sticky, very plastic; common very fine roots; common very fine vesicular and tubular pores; 90 percent continuous prominent clay films on faces of peds; 2 percent fine spherical iron-manganese

concretions throughout; 5 percent volcanic rock cobbles and 15 percent volcanic gravel; moderately alkaline, pH 8.0 by Hellige-Truog; gradual wavy boundary.

Bt4—23 to 29 inches (58 to 74 cm); light brown (7.5YR 6/4) very gravelly clay loam, brown (7.5YR 4/3) moist; 39 percent clay; moderate fine and medium subangular blocky structure; friable, moderately sticky, very plastic; common very fine roots; common very fine vesicular and tubular pores; 50 percent discontinuous distinct clay films on faces of peds; 5 percent fine spherical iron-manganese concretions throughout; 15 percent volcanic cobbles and 40 percent volcanic gravel; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt wavy boundary.

2Bqm—29 inches (74 cm); indurated duripan; extremely cobbly material; no manganese or silica capping; matted roots on top of the duripan.

Type location: Butte County, California; about 6.4 miles northeast of Nord, approximately 1,000 feet east and 900 feet south of the northwest corner of sec. 16, T. 23 N., R. 1 E.; 39 degrees, 51 minutes, 47 seconds north latitude and 121 degrees, 52 minutes, 38 seconds west longitude; NAD27; USGS Quad: Nord, California.

Range in Characteristics

Depth to the duripan is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 35 to 40 percent clay and 15 to 30 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 12 inches (30 cm) below the surface of the soil from December through April. Rock fragments on the surface range from 0 to 15 percent gravel and 0 to 10 percent cobbles.

The A horizon has dry color of 7.5YR 4/2 or 5/3 or 10YR 5/2. Moist color is 7.5YR 3/2 or 3/3 or 5YR 3/2 or 3/3. Texture is gravelly clay loam, cobbly loam, clay loam, or loam. The content of clay ranges from 18 to 33 percent. The horizon has 5 to 25 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 2 to 5 percent. Redoximorphic features range from 0 to 10 percent iron-manganese masses and 0 to 15 percent oxidized iron masses. Reaction ranges from moderately acid to neutral.

The Bt horizon has dry color of 7.5YR 4/3, 5/3, 5/4, 6/4, or 7/4 or 5YR 4/2. Moist color is 5YR 3/2, 3/3, 4/3, or 4/6 or 7.5YR 3/2, 3/3, 3/4, 4/2, or 4/3. Texture is gravelly clay, gravelly clay loam, very gravelly clay loam, extremely gravelly clay loam, cobbly clay loam, cobbly loam, clay, or loam. The content of clay ranges from 25 to 46 percent. The horizon has 5 to 50 percent gravel, 0 to 40 percent cobbles, and 0 to 5 percent stones. The content of organic matter is 0 to 1.2 percent. Redoximorphic features range from 0 to 5 percent iron-manganese masses, 0 to 10 percent manganese masses, and 0 to 5 percent spherical iron-manganese concretions. Reaction ranges from slightly acid to moderately alkaline.

The Tuscan taxadjunct is a taxadjunct because it has a nongravelly duripan rather than a gravelly one and is moderately deep rather than shallow. These differences do not significantly affect the use, management, or interpretations of the soils.

Tusccoll Series

The Tusccoll series consists of very deep, well drained soils that formed in colluvium derived from volcanic rocks. These soils are on backslopes in canyons in the Cascade Mountains. Slopes range from 30 to 70 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Fine-loamy, mixed, semiactive, mesic Andic Palexeralfs

Typical Pedon

Tusccoll gravelly loam, on a northeast-facing slope of 45 percent, under a cover of Douglas-fir, California black oak, redbud, dogwood, and Pacific poison oak, at an elevation of 1,940 feet (591 m). When described on 6/24/1998, the soil was very slightly moist to a depth of 23 inches (58 cm), slightly moist from 23 to 49 inches (58 to 124 cm), and moist below 49 inches (124 cm). (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; clear smooth boundary.

Oe—1 to 2 inches (3 to 5 cm); moderately decomposed plant material; clear smooth boundary.

A—2 to 6 inches (5 to 15 cm); light reddish brown (5YR 6/4) gravelly loam, reddish brown (5YR 4/3) moist; 25 percent clay; moderate fine and medium granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to medium tubular and irregular and few coarse tubular pores; 15 percent gravel; neutral, pH 7.0 by Hellige-Truog; NaF pH 10.0; clear smooth boundary.

Bt1—6 to 14 inches (15 to 36 cm); light reddish brown (5YR 6/4) gravelly loam, reddish brown (5YR 4/4) moist; 26 percent clay; moderate fine subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; many fine and medium, few coarse, and common very fine roots; common very fine to medium tubular and irregular and few coarse tubular pores; 40 percent discontinuous faint clay films; 25 gravel; neutral, pH 6.7 by Hellige-Truog; NaF pH 10.5; clear smooth boundary.

Bt2—14 to 23 inches (36 to 58 cm); light reddish brown (5YR 6/4) gravelly loam, reddish brown (5YR 4/4) moist; 27 percent clay; weak fine and medium subangular blocky structure; moderately hard, very friable, slightly sticky, slightly plastic; few very fine, fine, and coarse and many medium roots; common very fine to medium irregular and tubular and few coarse tubular pores; 40 percent discontinuous faint clay films; 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.5; gradual smooth boundary.

Bt3—23 to 33 inches (58 to 84 cm); reddish yellow (5YR 6/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 29 percent clay; weak fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; few very fine and fine and common medium and coarse roots; common very fine to medium tubular and irregular pores; 50 percent discontinuous faint clay films; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt4—33 to 41 inches (84 to 104 cm); yellowish red (5YR 5/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 31 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; few very fine and fine and common medium roots; common very fine and fine irregular and tubular and few medium tubular pores; 50 percent discontinuous faint clay films; 15 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 10.0; gradual smooth boundary.

Bt5—41 to 49 inches (104 to 124 cm); yellowish red (5YR 5/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 33 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; few very fine, fine, and coarse and common medium roots; common very fine and fine tubular and irregular and few medium tubular pores; 70 percent continuous distinct clay films; 15 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 9.9; clear smooth boundary.

Bt6—49 to 70 inches (124 to 179 cm); yellowish red (5YR 5/6) gravelly clay loam, yellowish red (5YR 4/6) moist; 38 percent clay; moderate fine and medium

subangular blocky structure; extremely hard, friable, moderately sticky, moderately plastic; few very fine to coarse roots; common very fine and fine tubular and irregular and few medium tubular pores; 80 percent continuous distinct clay films; 10 percent cobbles and 15 percent gravel; slightly acid, pH 6.3 by Hellige-Truog; NaF pH 9.7.

Type location: Butte County, California; about 0.75 mile west of Forest Ranch Cemetery, approximately 700 feet south and 600 feet west of the northeast corner of sec. 31, T. 24 N., R. 3 E.; 39 degrees, 54 minutes, 2 seconds north latitude and 121 degrees, 40 minutes, 31 seconds west longitude; NAD83; USGS Quad: Cohasset, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 52 to 59 degrees F (11 to 15 degrees C). The particle-size control section averages 22 to 35 percent clay and 5 to 35 percent rock fragments, mostly gravel. Mineralogy is mixed. NaF pH is 9.5 to 11.0 to a depth of 10 to 20 inches (25 to 51 cm). Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 5 percent boulders.

The A horizon has dry color of 7.5YR 5/3, 5/4, 6/3, 6/4, or 7/4 or 5YR 6/4. Moist color is 5YR 3/3 or 4/3 or 7.5YR 4/3. Texture is gravelly sandy loam, gravelly loam, or cobbly loam. The content of clay ranges from 17 to 25 percent. The horizon has 5 to 30 percent gravel and 0 to 15 percent cobbles. NaF pH is 9.5 to 11.0. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 5/3, 5/4, 5/6, 6/4, 6/6, or 7/4 or 5YR 5/4, 5/6, 6/4, or 6/6. Moist color is 7.5YR 3/3, 4/3, 4/4, 5/4, 4/6, or 6/6 or 5YR 3/3, 4/3, 4/4, or 4/6. Texture is loam, gravelly loam, cobbly loam, very cobbly loam, clay loam, gravelly clay loam, very gravelly clay loam, cobbly clay loam, very cobbly clay loam, gravelly sandy clay loam, or very gravelly sandy clay loam. The content of clay ranges from 20 to 39 percent. The horizon has 2 to 40 percent gravel, 0 to 40 percent cobbles, and 0 to 15 percent stones. NaF pH is 9.8 to 11.0 in the upper part of the horizon. Reaction ranges from very strongly acid to neutral.

Typic Haploxeralfs

Typic Haploxeralfs consist of moderately deep or deep, well drained soils that formed in colluvium, residuum, and alluvium derived from volcanic rocks. These soils are on side slopes in canyons on Cascade foothills. Slopes range from 2 to 50 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Thermic Typic Haploxeralfs

Typical Pedon

Typic Haploxeralfs gravelly loam, on a south-southwest-facing slope of 45 percent, under a cover of yellow starthistle and wild oat with scattered interior live oak, Pacific poison oak, and foothill pine, at an elevation of 530 feet (162 m). When described on 11/9/1998, the soil was moist to a depth of 8 inches (20 cm) and dry below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); grayish brown (10YR 5/2) gravelly loam, very dark grayish brown (10YR 3/2) moist; 27 percent clay; moderate very fine and fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine to medium irregular and tubular pores; 25 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt1—2 to 8 inches (5 to 20 cm); grayish brown (10YR 5/2) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 29 percent clay; strong fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; many very fine roots; common very fine to medium tubular pores; 40 percent discontinuous faint clay films; 20 percent gravel; neutral, pH 7.3 by Hellige-Truog; clear smooth boundary.

Bt2—8 to 16 inches (20 to 41 cm); grayish brown (10YR 5/2) very gravelly clay loam, dark grayish brown (10YR 4/2) moist; 35 percent clay; strong fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine and fine roots; common very fine to medium tubular pores; 80 percent continuous distinct clay films; 15 percent cobbles and 25 percent gravel; neutral, pH 7.3 by Hellige-Truog; gradual smooth boundary.

Bt3—16 to 27 inches (41 to 69 cm); grayish brown (10YR 5/2) very gravelly clay loam, dark grayish brown (10YR 4/2) moist; 33 percent clay; strong fine and medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 15 percent cobbles and 30 percent gravel; neutral, pH 7.3 by Hellige-Truog; gradual smooth boundary.

Bt4—27 to 40 inches (69 to 102 cm); grayish brown (10YR 5/2) very gravelly clay loam, dark grayish brown (10YR 4/2) moist; 32 percent clay; strong fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 15 percent cobbles and 40 percent gravel; neutral, pH 7.3 by Hellige-Truog; abrupt irregular boundary.

2Cr—40 inches (102 cm); white (10YR 8/1), weakly cemented volcanic sandstone, brown (10YR 4/3) moist; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 0.25 mile northeast of Horseshoe Lake, approximately 7,100 feet north and 2,100 feet west of the southeast corner of sec. 17, T. 22 N., R. 2 E.; in an unsectionized area in the Arroyo Chico Land Grant; 39 degrees, 46 minutes, 29 seconds north latitude and 121 degrees, 46 minutes, 34 seconds west longitude; NAD83; USGS Quad: Richardson Springs, California.

Range in Characteristics

The depth to paralithic or lithic bedrock is 20 to 60 inches (51 to 102 cm). The mean annual soil temperature is 59 to 67 degrees F (15 to 19 degrees C). The soil moisture control section is dry in all parts from about June to October (about 150 days). The particle-size control section averages 27 to 45 percent clay and 15 to 65 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 0 to 25 percent gravel, 0 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 20 percent boulders.

The A horizon has dry color of 7.5YR 5/2, 5/3, 5/4, 6/4, or 7/3 or 10YR 5/2, 6/2, or 6/3. Moist color is 7.5YR 3/2, 4/2, or 4/3; 10YR 3/2 or 4/2; or 5YR 3/2 or 4/3. Texture is loam, gravelly loam, very gravelly loam, clay loam, or sandy clay loam. The content of clay ranges from 20 to 30 percent. The horizon has 5 to 25 percent gravel and 0 to 15 percent cobbles. Reaction ranges from slightly acid to slightly alkaline.

The Bt horizon has dry color of 7.5YR 5/2, 5/3, 5/4, 6/3, 6/4, or 7/3; 10YR 5/2, 6/2, 6/3, or 7/3; or 5YR 5/4. Moist color is 7.5YR 3/3, 4/2, 4/3, 4/4, or 5/3; 10YR 4/2 or 5/3; or 5YR 3/3 or 4/3. Texture is clay loam, gravelly clay loam, very gravelly clay loam, extremely gravelly clay loam, cobbly clay loam, very cobbly clay loam, clay, very gravelly clay, very cobbly clay, extremely gravelly clay, sandy clay loam, gravelly sandy clay loam, very stony sandy clay loam, sandy clay, gravelly sandy clay, cobbly sandy clay, or very gravelly sandy clay. The content of clay ranges from 27 to 50 percent. The horizon has 5 to 45 percent gravel, 0 to 30 percent cobbles, and 0 to 25 percent stones. Reaction ranges from neutral to moderately alkaline.

Typic Haploxeralfs, Magnesic

Typic Haploxeralfs, magnesic, consist of moderately deep to very deep, well drained soils that formed in residuum and colluvium derived from serpentinitic ultramafic rocks. These soils are on ridgetops and side slopes on ultramafic Sierra Nevada mountains. Slopes range from 15 to 80 percent. The mean annual precipitation is about 60 inches (1,524 mm), and the mean annual air temperature is about 55 degrees F (13 degrees C).

Taxonomic class: Magnesic, mesic Typic Haploxeralfs

Typical Pedon

Typic Haploxeralfs, magnesic, very gravelly loam, on a south-southeast-facing slope of 42 percent, under a cover of whiteleaf manzanita, whitethorn ceanothus, foothill pine, California laurel, California buckthorn, toyon, and scrub oak, at an elevation of 2,578 feet (786 m). When described on 9/25/1997, the soil was dry to a depth of 32 inches (81 cm) and very slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (7.5YR 5/4) very gravelly loam, dark brown (7.5YR 3/4) moist; 24 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; common very fine and fine roots; many very fine and fine and common medium tubular pores; 10 percent cobbles and 30 percent gravel; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

Bt1—3 to 7 inches (8 to 18 cm); reddish brown (5YR 5/4) gravelly clay loam, reddish brown (5YR 4/4) moist; 28 percent clay; strong fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; common very fine and fine and few medium irregular and tubular pores; 30 percent discontinuous faint clay films on faces of peds and 70 percent clay bridges; 5 percent cobbles and 25 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt2—7 to 12 inches (18 to 30 cm); reddish brown (5YR 5/4) very gravelly clay loam, reddish brown (5YR 4/4) moist; 35 percent clay; strong fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine and fine roots; common very fine and fine and few medium irregular and tubular pores; 70 percent discontinuous faint clay films on faces of peds; 15 percent cobbles and 35 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt3—12 to 18 inches (30 to 46 cm); reddish brown (5YR 4/4) gravelly clay, dark reddish brown (2.5YR 3/4) moist; 42 percent clay; strong fine and medium subangular blocky structure; hard, very firm, moderately sticky, very plastic; common very fine and fine roots; common very fine and fine and few medium irregular and tubular pores; 80 percent continuous distinct clay films on faces of peds; 5 percent cobbles and 25 percent gravel; neutral, pH 7.2 by Hellige-Truog; clear smooth boundary.

Bt4—18 to 24 inches (46 to 61 cm); yellowish red (5YR 4/6) very gravelly clay, yellowish red (5YR 4/6) moist; 45 percent clay; strong fine and medium subangular blocky structure; extremely hard, very firm, moderately sticky, very plastic; common very fine and fine and few medium roots; few very fine and fine irregular and tubular pores; 90 percent continuous distinct clay films on faces of peds; 15 percent cobbles and 20 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Btss1—24 to 32 inches (61 to 81 cm); strong brown (7.5YR 5/6) very gravelly clay, reddish brown (5YR 4/4) moist; 50 percent clay; moderate coarse prismatic

structure parting to strong coarse angular blocky; extremely hard, very firm, very sticky, very plastic; common very fine and fine and few medium roots; few very fine and fine irregular and tubular pores; 50 percent slickensides and 90 percent continuous prominent clay films on faces of peds; 15 percent cobbles and 40 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Btss2—32 to 42 inches (81 to 107 cm); brown (7.5YR 4/3) very gravelly clay, strong brown (7.5YR 5/6) moist; 42 percent clay; strong fine and medium subangular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few very fine to medium roots; few very fine and fine irregular and tubular pores; 20 percent slickensides and 90 percent continuous prominent clay films on faces of peds; 20 percent cobbles and 40 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt irregular boundary.

B´t5—42 to 54 inches (107 to 137 cm); brown (7.5YR 4/3) extremely cobbly clay loam, strong brown (7.5YR 5/6) moist; 38 percent clay; strong fine and medium subangular blocky structure; extremely hard, very firm, moderately sticky, very plastic; few very fine and fine roots; few very fine and fine irregular and tubular pores; 80 percent continuous prominent clay films on faces of peds and in pores; 40 percent gravel and 40 percent cobbles; slightly alkaline, pH 7.5 by Hellige-Truog; abrupt irregular boundary.

R—54 inches (137 cm); indurated serpentinite bedrock.

Type location: Butte County, California; about 1.5 miles northeast of Magalia, approximately 2,400 feet north and 1,500 feet east of the southwest corner of sec. 29, T. 23 N., R. 4 E.; 39 degrees, 49 minutes, 13 seconds north latitude and 121 degrees, 33 minutes, 21 seconds west longitude; NAD83; USGS Quad: Paradise East, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 80 inches (51 to 203 cm). The mean annual soil temperature is 52 to 59 degrees F (11 to 15 degrees C). The soil moisture control section is dry in all parts from about July to October (about 120 days). The particle-size control section averages 25 to 50 percent clay and 35 to 50 percent rock fragments, mostly gravel and cobbles. Mineralogy is magnesic. Rock fragments on the surface range from 10 to 60 percent gravel, 5 to 35 percent cobbles, 0 to 20 percent stones, and 0 to 15 percent boulders.

The A horizon has dry color of 7.5YR 5/4 or 6/4 or 5YR 5/4. Moist color is 7.5YR 3/4 or 4/3, 5YR 4/3, or 2.5YR 3/4. Texture is gravelly loam, very gravelly loam, or gravelly clay loam. The content of clay ranges from 22 to 32 percent. The horizon has 20 to 40 percent gravel, 0 to 20 percent cobbles, and 0 to 10 percent stones. Reaction is neutral.

The Bt horizon has dry color of 5YR 4/4, 4/6, 5/4, or 5/6 or 7.5YR 6/4, 7/4, or 7/6. Moist color is 5YR 4/4 or 4/6, 2.5YR 3/4 or 4/6, or 7.5YR 4/6. Texture is clay loam, clay, or the gravelly, very gravelly, extremely gravelly, or cobbly analogs of those textures. The content of clay ranges from 27 to 45 percent. The horizon has 0 to 40 percent gravel, 0 to 45 percent cobbles, and 0 to 15 percent stones. Reaction is neutral or slightly alkaline.

The Btss horizon has dry color of 7.5YR 4/3, 4/4, 4/6, or 5/6; 5YR 6/4; or 2.5YR 5/6 or 6/6. Moist color is 5YR 4/4, 5/4, or 5/6; 7.5YR 5/6; or 2.5YR 4/6. Texture is extremely gravelly clay loam, gravelly clay, very gravelly clay, or very cobbly clay. The content of clay ranges from 35 to 50 percent. The horizon has 25 to 65 percent gravel, 0 to 45 percent cobbles, and 0 to 15 percent stones. Reaction is neutral or slightly alkaline.

Typic Petraquepts

Typic Petraquepts consist of shallow, poorly drained soils that formed in alluvium derived from basalt. These soils are in swales on strath terraces on Southern Cascade foothills. Slopes are 0 to 1 percent. The mean annual precipitation is about 25 inches (635 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Clayey, smectitic, thermic, shallow Typic Petraquepts

Typical Pedon

Typic Petraquepts silty clay, on a slope of 1 percent, under a cover of annual grasses and forbs, at an elevation of 184 feet (56 m). When described on 5/4/2000, the soil was slightly moist at a depth of 3 to 11 inches (8 to 28 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); dark gray (10YR 4/1) silty clay, very dark gray (10YR 3/1) moist; 50 percent clay; moderate thin platy structure parting to moderate very fine subangular blocky; very hard, extremely firm, very sticky, very plastic; many very fine roots; few very fine tubular pores; 20 percent fine irregular strong brown (7.5YR 5/6 dry) oxidized iron masses on surfaces along root channels; 10 percent subrounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Bss—3 to 11 inches (8 to 28 cm); gray (10YR 5/1) gravelly silty clay, dark gray (10YR 4/1) moist; 55 percent clay; strong medium angular blocky structure; extremely hard, extremely firm, very sticky, very plastic; common very fine roots; few very fine tubular pores; 10 percent slickensides; 5 percent fine irregular black (N 2/0 dry) manganese masses in the matrix and 15 percent fine irregular strong brown (7.5YR 5/6 dry) oxidized iron masses on surfaces along root channels; 5 percent subrounded basalt cobbles and 25 percent subrounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

2Bqm—11 inches (28 cm); indurated duripan; cemented by silica; many very fine roots on top of the horizon; 70 percent fine platy black (N 2/0 dry) manganese masses at the top of the horizon; 5 percent rounded basalt cobbles and 50 percent well rounded basalt gravel; silica- and manganese-cemented capping, 1/8 to 1/4 inch thick, that is discontinuous because well rounded to subrounded basalt and chert gravel and cobbles protrude through the top of the duripan.

Type location: Butte County, California; about 5.3 miles northwest of Oroville, approximately 1,450 feet west and 2,500 feet north of the southeast corner of sec. 28, T. 20 N., R. 3 E.; 39 degrees, 33 minutes, 33 seconds north latitude and 121 degrees, 38 minutes, 28 seconds west longitude; NAD83; USGS Quad: Shippee, California.

Range in Characteristics

Depth to the duripan is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 40 to 60 percent clay and 20 to 35 percent rock fragments, mostly gravel. Mineralogy is smectitic. The content of organic matter is 0 to 1 percent in the A horizon and less than 1 percent in the Bss horizon. By ammonium acetate, base saturation ranges from 90 to 100 percent throughout the profile. Reversible, surface-initiated cracks 0.25 to 1 inch (0.6 to 2.5 cm) wide extend from the surface to the duripan from May through October (150 to 180 days) when the soils are not irrigated. A fluctuating water table can occur between the top of the duripan and the surface of the soil from November through April. The soils are frequently ponded for very long periods; as much as 6 inches of water ponds on the surface from November through April. Redoximorphic features, such as oxidized iron masses, iron-manganese

masses, and manganese masses, occur in all horizons. Rock fragments on the surface range from 5 to 10 percent gravel and 2 to 5 percent cobbles. Some pedons do not have slickensides or a Bss horizon.

The A horizon has dry color of 10YR 4/1, 4/2, or 5/2. Moist color is 10YR 3/1 or 3/2. Texture is silty clay, clay, or clay loam. The content of clay ranges from 38 to 50 percent. The horizon has 5 to 10 percent gravel and 0 to 5 percent cobbles. Reaction ranges from strongly acid to slightly acid.

The Bss horizon has dry color of 10YR 4/2, 5/1, or 5/2. Moist color is 10YR 3/2 or 4/1. Texture is gravelly silty clay. The content of clay ranges from 42 to 55 percent. The horizon has 25 to 35 percent gravel and 0 to 5 percent cobbles. Reaction ranges from strongly acid to slightly acid.

Typic Xerofluvents

Typic Xerofluvents consist of very deep, somewhat excessively drained soils that formed in alluvium derived from hydraulic mine deposits from the Cherokee Gold Mine. These soils are on stream terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Mixed, superactive, nonacid, thermic Typic Xerofluvents

Reference Pedon

Typic Xerofluvents gravelly loamy sand, on a southeast-facing slope of 2 percent, under a cover of cottonwood, black walnut, valley oak, California sycamore, Pacific poison oak, and annual grasses, at an elevation of 305 feet (93 m). When described on 4/10/2001, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); light yellowish brown (10YR 6/4) gravelly loamy sand, dark brown (10YR 3/3) moist; 8 percent clay; weak medium subangular blocky structure parting to weak fine granular; soft, friable, nonsticky, nonplastic; many fine and medium roots; many fine irregular pores; 20 percent subrounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; clear wavy boundary.

C1—3 to 11 inches (8 to 28 cm); light yellowish brown (10YR 6/4) gravelly coarse sandy loam, brown (10YR 4/3) moist; 10 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, nonsticky, nonplastic; common very fine and fine and many medium roots; common fine irregular pores; 25 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

C2—11 to 20 inches (28 to 51 cm); yellowish brown (10YR 5/4) gravelly coarse sandy loam, dark yellowish brown (10YR 4/4) moist; 12 percent clay; moderate coarse subangular blocky structure; hard, firm, nonsticky, nonplastic; many medium and coarse and common very fine roots; common fine tubular pores; 30 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; abrupt smooth boundary.

C3—20 to 24 inches (51 to 61 cm); light yellowish brown (10YR 6/4) sand, yellowish brown (10YR 5/4) moist; 2 percent clay; single grain; loose, very friable, nonsticky, nonplastic; common fine and medium roots; common fine irregular pores; 15 percent medium yellowish brown (10YR 5/6) oxidized iron masses; 10 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; abrupt smooth boundary.

C4—24 to 31 inches (61 to 79 cm); light yellowish brown (10YR 6/4) gravelly sand, yellowish brown (10YR 5/4) moist; 4 percent clay; weak fine subangular blocky structure parting to single grain; soft, friable, nonsticky, nonplastic; common fine

and medium and few very fine roots; common fine irregular pores; 30 percent medium black (10YR 2/1) manganese masses and 35 percent medium dark yellowish brown (10YR 4/6) oxidized iron masses; 20 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; abrupt wavy boundary.

C5—31 to 45 inches (79 to 114 cm); very pale brown (10YR 7/4) silt loam, brown (10YR 5/3) moist; 15 percent clay; moderate medium and coarse subangular blocky structure; slightly hard, firm, slightly sticky, slightly plastic; common medium and coarse and few very fine roots; common very fine tubular pores; 30 percent medium dark gray (10YR 4/1) manganese masses and 50 percent medium dark yellowish brown (10YR 4/6) oxidized iron masses; 5 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; abrupt wavy boundary.

C6—45 to 51 inches (114 to 130 cm); very pale brown (10YR 8/2) gravelly sand, light brownish gray (10YR 6/2) moist; 2 percent clay; single grain; loose, very friable, nonsticky, nonplastic; common medium and coarse roots; few fine irregular pores; 15 percent medium yellowish brown (10YR 5/6) oxidized iron masses; 30 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; abrupt wavy boundary.

C7—51 to 66 inches (130 to 168 cm); light gray (10YR 7/2) silt, 40 percent yellowish brown (10YR 5/6) and 60 percent light brownish gray (10YR 6/2) moist; 10 percent clay; moderate coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few medium and coarse roots; few very fine irregular pores; 30 percent fine dark gray (10YR 4/1) iron depletions; 10 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog; abrupt wavy boundary.

C8—66 to 84 inches (168 to 213 cm); very pale brown (10YR 8/2) very gravelly coarse sand, light brownish gray (10YR 6/2) moist; 1 percent clay; single grain; loose, very friable, nonsticky, nonplastic; common fine irregular pores; 30 percent fine yellowish brown (10YR 5/6) oxidized iron masses; 50 percent subrounded mixed rock gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

C9—84 to 95 inches (213 to 241 cm); very pale brown (10YR 7/4) extremely gravelly coarse sand, yellowish brown (10YR 5/4) moist; 4 percent clay; single grain; loose, very friable, nonsticky, nonplastic; common fine irregular pores; 50 percent fine dark yellowish brown (10YR 4/6) oxidized iron masses; 70 percent subrounded mixed gravel; neutral, pH 6.8 by Hellige-Truog.

The reference pedon is an example of the soils in this category. The properties represented in map units 360 and 361 vary. The particle-size classes represented by this description include coarse-loamy and sandy-skeletal.

Type location: Butte County, California; about 4.5 miles west of Cherokee, approximately 500 feet west and 500 feet north of the southeast corner of sec. 34, T. 21 N., R. 3 E.; 39 degrees, 37 minutes, 30 seconds north latitude and 121 degrees, 37 minutes, 23 seconds west longitude; NAD83; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to buried alluvium or sandstone or weathered basalt is 40 to 110 inches or more (102 to 279 cm or more). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section averages 2 to 9 percent clay and 17 to 50 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur at a depth of 20 to 94 inches (51 to 240 cm) from December through April. Rock fragments on the surface range from 0 to 10 percent gravel.

The A horizon has dry color of 10YR 4/3, 5/2, 5/3, 6/2, 6/3, or 6/4. Moist color is 10YR 3/2, 3/3, 4/2, 4/3, or 4/4. Texture is gravelly loamy sand, sandy loam, fine sandy

loam, gravelly loam, loam, or gravelly loamy coarse sand. The content of clay ranges from 5 to 18 percent. The content of gravel is 0 to 30 percent. The content of organic matter is 0 to 0.5 percent. Reaction ranges from extremely acid to slightly alkaline.

The C horizon has dry color of 10YR 5/3, 5/4, 6/2, 6/3, 6/4, 6/6, 7/2, 7/3, 7/4, 7/6, 8/2, 8/3, or 8/4; 7.5YR 6/4, 7/4, or 7/6; or 2.5Y 6/2, 6/3, or 6/4. Moist color is 10YR 3/3, 3/4, 4/2, 4/3, 4/4, 4/6, 5/2, 5/3, 5/4, 5/6, 6/2, 6/3, or 6/4; 7.5YR 4/4, 5/4, or 5/6; or 2.5Y 5/3 or 5/4. Texture is sand, gravelly sand, very gravelly sand, gravelly coarse sand, very gravelly loamy coarse sand, very gravelly coarse sand, extremely gravelly coarse sand, very gravelly coarse sandy loam, sandy loam, very gravelly sandy loam, fine sandy loam, very fine sandy loam, gravelly very fine sandy loam, loam, gravelly loam, silt, silt loam, or silty clay loam. The content of clay ranges from 1 to 32 percent. The content of gravel is 5 to 80 percent. The content of organic matter is 0 to 0.2 percent. Redoximorphic features occur as oxidized iron masses and manganese masses. Reaction ranges from moderately acid to moderately alkaline.

The 2Ab, 2Btb or 2Bw horizon, where it occurs, has dry color of 10YR 4/2, 5/1, 5/2, or 5/3 or 7.5YR 6/2. Moist color is 10YR 2/2, 3/1, 3/2, or 3/3 or 7.5YR 4/2. Texture is sandy loam, loam, sandy clay loam, or clay loam. The content of clay ranges from 10 to 35 percent. The content of gravel is 5 to 15 percent. Redoximorphic features occur as oxidized iron masses. Reaction ranges from neutral to moderately alkaline.

Ultic Haploxeralfs

Ultic Haploxeralfs consist of moderately deep or deep, well drained soils that formed in colluvium and residuum derived from volcanic rocks. These soils are on side slopes in canyons on Cascade foothills. Slopes range from 30 to 100 percent. The mean annual precipitation is about 41 inches (1,041 mm), and the mean annual air temperature is about 58 degrees F (14 degrees C).

Taxonomic class: Mesic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs gravelly loam, on a northeast-facing slope of 45 percent, under a cover of scrub oak, manzanita, Pacific poison oak, California laurel, and scattered foothill pine, at an elevation of 1,075 feet (328 m). When described on 9/29/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 4 inches (0 to 10 cm); light brown (7.5YR 6/3) gravelly loam, brown (7.5YR 4/2) moist; 24 percent clay; moderate medium and coarse subangular blocky structure parting to strong fine and medium granular; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to medium and common coarse irregular and tubular pores; 20 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bt1—4 to 10 inches (10 to 25 cm); light brown (7.5YR 6/4) gravelly loam, brown (7.5YR 4/3) moist; 26 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium and coarse roots; many very fine to coarse tubular pores; 40 percent continuous faint clay films; 15 percent gravel; slightly acid, pH 6.6 by Hellige-Truog; clear smooth boundary.

Bt2—10 to 18 inches (25 to 46 cm); light brown (7.5YR 6/4) gravelly clay loam, brown (7.5YR 4/3) moist; 29 percent clay; moderate fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to coarse roots; many very fine to medium and common coarse tubular pores; 60 percent continuous faint clay films; 15 percent gravel; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bt3—18 to 35 inches (46 to 89 cm); light brown (7.5YR 6/4) gravelly clay loam, brown (7.5YR 4/3) moist; 35 percent clay; strong fine and medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films; 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; clear smooth boundary.

Bt4—35 to 48 inches (89 to 122 cm); light brown (7.5YR 6/4) gravelly clay, brown (7.5YR 4/3) moist; 45 percent clay; strong fine and medium subangular blocky structure; rigid, friable, very sticky, very plastic; common very fine and fine roots; common very fine and fine and few medium tubular pores; 90 percent continuous distinct clay films; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

Crt—48 inches (122 cm); extremely weakly cemented volcanic conglomerate bedrock.

Type location: Butte County, California; about 1.1 miles southwest of Centerville, approximately 1,400 feet south and 375 feet east of the northwest corner of sec. 8, T. 22 N., R. 3 E.; 39 degrees, 46 minutes, 51 seconds north latitude and 121 degrees, 40 minutes, 25 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to paralithic or lithic bedrock is 20 to 60 inches (51 to 152 cm). The mean annual soil temperature is 55 to 59 degrees F (13 to 15 degrees C). The soil moisture control section is dry in all parts from about June to October (about 150 days). The particle-size control section averages 27 to 35 percent clay and 10 to 50 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 0 to 25 percent gravel, 0 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 5 percent boulders. Some pedons have 20 to 35 percent clay in the lower part of the Bt horizon.

The A horizon has dry color of 7.5YR 5/3, 6/2, 6/3, or 6/4. Moist color is 7.5YR 3/2, 3/3, or 4/2. Texture is gravelly loam or very gravelly loam. The content of clay ranges from 20 to 26 percent. The content of gravel is 15 to 40 percent. Reaction ranges from slightly acid to slightly alkaline.

The upper part of the Bt horizon has dry color of 7.5YR 5/3, 5/4, 6/3, or 6/4. Moist color is 7.5YR 4/2, 4/3, or 4/4. Texture is gravelly loam, cobbly loam, clay loam, gravelly clay loam, very gravelly clay loam, cobbly clay loam, or very cobbly clay loam. The content of clay ranges from 23 to 35 percent. The content of gravel is 5 to 50 percent, the content of cobbles is 0 to 20 percent, and the content of stones is 0 to 20 percent. Reaction ranges from slightly acid to slightly alkaline.

The lower part of the Bt horizon has dry color of 7.5YR 5/4, 6/3, or 6/4. Moist color is 7.5YR 4/3 or 4/4. Texture is gravelly clay loam, very gravelly clay loam, or gravelly clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 15 to 50 percent, the content of cobbles is 0 to 20 percent, and the content of stones is 0 to 20 percent. Reaction is slightly acid or neutral.

Ultic Haploxeralfs, Conglomerate

Ultic Haploxeralfs, conglomerate, consist of moderately deep to very deep, well drained soils that formed in colluvium and residuum derived from marine conglomerate. These soils are on side slopes in canyons on Cascade foothills. Slopes range from 3 to 100 percent. The mean annual precipitation is about 57 inches (1,447 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Thermic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs, conglomerate, gravelly clay loam, on a northeast-facing slope of 53 percent, under a cover of canyon live oak, California black oak, foothill pine, Pacific poison oak, toyon, tanoak, hedgehog dogtail, and a few ponderosa pine trees, at an elevation of 1,200 feet (366 m). When described on 9/10/1998, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 2 inches (0 to 5 cm); slightly decomposed plant material; abrupt smooth boundary.

A—2 to 6 inches (5 to 15 cm); pale brown (10YR 6/3) gravelly clay loam, brown (10YR 4/3) moist; 29 percent clay; strong fine and medium granular structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine and fine and few medium roots; many very fine to coarse tubular and irregular pores; 25 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt1—6 to 10 inches (15 to 25 cm); light yellowish brown (10YR 6/4) gravelly clay loam, brown (7.5YR 4/3) moist; 31 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium roots; many very fine to medium tubular pores; 50 percent discontinuous faint clay films; 15 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt2—10 to 17 inches (25 to 43 cm); light brown (7.5YR 6/4) clay loam, brown (7.5YR 4/2) moist; 33 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many fine and medium and common very fine roots; many very fine to medium tubular pores; 60 percent discontinuous faint clay films; 10 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt3—17 to 28 inches (43 to 71 cm); light brown (7.5YR 6/4) cobbly clay loam, brown (7.5YR 4/3) moist; 35 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine to medium tubular pores; 60 percent discontinuous faint clay films; 10 percent gravel and 20 percent cobbles; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt4—28 to 40 inches (71 to 102 cm); light brown (7.5YR 6/4) very cobbly clay loam, brown (7.5YR 4/4) moist; 36 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; 70 percent continuous distinct clay films; 20 percent gravel and 25 percent cobbles; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

2Bt5—40 to 50 inches (102 to 127 cm); strong brown (7.5YR 5/6) very gravelly clay, brown (7.5YR 4/4) moist; 42 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, very sticky, very plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; 90 percent continuous prominent clay films; 20 percent cobbles and 25 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

2Bt6—50 to 71 inches (127 to 180 cm); strong brown (7.5YR 5/6) very gravelly sandy clay loam, brown (7.5YR 4/4) moist; 32 percent clay; massive; slightly hard, friable, moderately sticky, moderately plastic; common very fine to medium roots; many very fine and fine and common medium tubular pores; 50 percent discontinuous distinct clay films; 15 cobbles and 40 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

2Bt7—71 to 84 inches (180 to 213 cm); strong brown (7.5YR 5/6) very gravelly sandy clay loam, brown (7.5YR 4/4) moist; 29 percent clay; massive; slightly hard, friable, moderately sticky, moderately plastic; few very fine to medium roots; many very fine and fine and common medium tubular pores; 50 percent discontinuous

distinct clay films; 20 percent cobbles and 40 percent gravel; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Butte County, California; about 0.25 mile southeast of the Ponderosa Way bridge over Big Chico Creek, approximately 1,300 feet south and 120 feet west of the northeast corner of sec. 1, T. 23 N., R. 2 E.; 39 degrees, 53 minutes, 8 seconds north latitude and 121 degrees, 41 minutes, 43 seconds west longitude; NAD83; USGS Quad: Cohasset, California.

Range in Characteristics

The depth to paralithic bedrock is 20 to more than 80 inches (51 to 203 cm). The mean annual soil temperature is 59 to 62 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about June to November (about 150 days). The particle-size control section averages 30 to 40 percent clay and 20 to 70 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 10 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 10YR 5/4 or 6/3; 7.5YR 5/4, 6/2, 6/3, or 7/3; or 5YR 6/4. Moist color is 10YR 4/3 or 4/4; 7.5YR 3/2, 4/2, 4/3, or 5/4; or 5YR 4/3. Texture is gravelly loam, very gravelly loam, gravelly clay loam, or very gravelly sandy clay loam. The content of clay ranges from 23 to 30 percent. The horizon has 15 to 45 percent gravel, 0 to 10 percent cobbles, and 0 to 3 percent stones. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 10YR 5/4, 6/4, or 7/4; 7.5YR 4/4, 6/2, 6/3, 6/4, 7/4, or 7/6; or 5YR 5/4, 5/6, or 6/4. Moist color is 10YR 4/4 or 5/4; 7.5YR 4/2, 4/3, 4/4, 5/4, 5/6, or 6/6; or 5YR 4/3, 4/4, 4/6, or 5/6. Texture is clay loam, gravelly clay loam, very gravelly clay loam, cobbly clay loam, very cobbly clay loam, gravelly sandy clay loam, very gravelly sandy clay loam, or extremely gravelly sandy clay loam. The content of clay ranges from 25 to 40 percent. The horizon has 10 to 45 percent gravel, 0 to 30 percent cobbles, and 0 to 5 percent stones. Reaction is slightly acid or moderately acid.

The 2Bt horizon has dry color of 5YR 4/4, 4/6, 6/4, or 7/6 or 7.5YR 5/6. Moist color is 2.5YR 3/4, 3/6, or 4/6; 5YR 4/4 or 5/8; or 7.5YR 4/4. Texture is very gravelly clay loam, very gravelly sandy clay loam, gravelly clay, very gravelly clay, cobbly clay, very cobbly clay, or extremely cobbly clay. The content of clay ranges from 30 to 50 percent. The horizon has 10 to 45 percent gravel, 10 to 40 percent cobbles, and 0 to 5 percent stones. Reaction ranges from slightly acid to strongly acid.

Ultic Haploxeralfs, Mesic

Ultic Haploxeralfs, mesic, consist of moderately deep or deep, well drained soils that formed in residuum derived from mudflow breccia. These soils are on the top of ridges on Cascade foothills. Slopes range from 2 to 30 percent. The mean annual precipitation is about 50 inches (1,270 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Mesic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs, mesic, gravelly loam, on a south-facing slope of 17 percent, under a cover of manzanita, scrub oak, and Pacific poison oak, at an elevation of 1,915 feet (584 m). When described on 9/27/1999, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.
A—1 to 4 inches (3 to 10 cm); reddish brown (5YR 5/4) gravelly loam, reddish brown (5YR 4/4) moist; 23 percent clay; strong fine granular structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine to medium and common coarse tubular and irregular pores; 25 percent gravel; slightly acid, pH 6.4 by pH meter 1:1 water; clear smooth boundary.
Bt1—4 to 9 inches (10 to 23 cm); reddish yellow (5YR 6/6) cobbly loam, reddish brown (5YR 4/4) moist; 25 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine to medium and common coarse roots; many very fine to medium and few coarse tubular and irregular pores; 80 percent continuous distinct clay films on faces of peds; 10 percent gravel and 20 percent cobbles; slightly acid, pH 6.6 by pH meter 1:1 water; clear smooth boundary.
Bt2—9 to 23 inches (23 to 58 cm); reddish yellow (5YR 6/6) very stony clay loam, reddish brown (2.5YR 5/4) moist; 31 percent clay; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; many very fine to medium and common coarse roots; many very fine to medium tubular pores; 80 percent continuous distinct clay films on faces of peds; 10 percent gravel, 20 percent cobbles, and 20 percent stones; slightly acid, pH 6.5 by pH meter 1:1 water; gradual smooth boundary.
Bt3—23 to 32 inches (58 to 81 cm); reddish yellow (5YR 6/6) very cobbly clay loam, red (2.5YR 5/6) moist; 34 percent clay; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine to medium tubular pores; 90 percent continuous distinct clay films on faces of peds; 10 percent stones, 20 percent gravel, and 20 percent cobbles; slightly acid, pH 6.5 by pH meter 1:1 water; abrupt smooth boundary.
Bt4—32 to 42 inches (81 to 107 cm); light red (2.5YR 6/6) extremely stony clay loam, red (2.5YR 5/6) moist; 37 percent clay; moderate fine and medium subangular blocky structure; moderately hard, firm, moderately sticky, moderately plastic; common very fine to medium roots; common very fine and fine and few medium tubular pores; 90 percent continuous distinct clay films on faces of peds; 20 percent gravel, 20 percent cobbles, and 30 percent stones; moderately acid, pH 6.1 by pH meter 1:1 water; clear smooth boundary.
Cr—42 inches (107 cm); moderately cemented mudflow breccia bedrock.

Type location: Butte County, California; about 850 feet north-northwest of Doe Mill Point, approximately 1,850 feet north and 300 feet east of the southwest corner of sec. 32, T. 23 N., R. 3 E.; 39 degrees, 48 minutes, 15 seconds north latitude and 121 degrees, 40 minutes, 29 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to lithic or paralithic bedrock is 20 to 60 inches (51 to 152 cm). The mean annual soil temperature is 55 to 59 degrees F (13 to 15 degrees C). The soil moisture control section is dry in all parts from about June to October (about 150 days). The particle-size control section averages 27 to 40 percent clay and 5 to 80 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 5 to 25 percent gravel, 0 to 20 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 5YR 5/4, 6/3, or 6/4 or 7.5YR 4/3 or 5/4. Moist color is 5YR 4/3 or 4/4 or 7.5YR 3/2, 3/4, or 4/3. Texture is loam, gravelly loam, or very gravelly loam. The content of clay ranges from 20 to 26 percent. The horizon has 2 to

35 percent gravel, 0 to 10 percent cobbles, and 0 to 5 percent stones. By sum of cations, base saturation ranges from 40 to 65 percent. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 5YR 4/4, 5/4, or 6/6 or 7.5YR 5/4. Moist color is 2.5YR 5/4 or 5/6, 5YR 4/3 or 4/4, or 7.5YR 3/4 or 4/3. Texture is loam, gravelly loam, cobbly loam, clay loam, gravelly clay loam, very gravelly clay loam, cobbly clay loam, very cobbly clay loam, or very stony clay loam. The content of clay ranges from 25 to 35 percent. The content of gravel is 2 to 25 percent, the content of cobbles is 0 to 20 percent, and the content of stones is 0 to 20 percent. By sum of cations, base saturation ranges from 40 to 60 percent. Reaction is slightly acid or neutral.

The lower part of the Bt horizon has dry color of 2.5YR 3/4, 4/6, or 6/6 or 5YR 5/4 or 4/6. Moist color is 2.5YR 3/4, 4/4, or 5/6 or 5YR 4/3, 4/4, or 4/6. Texture is clay loam, gravelly clay loam, cobbly clay loam, very stony clay loam, extremely stony clay loam, clay, gravelly clay, very gravelly clay, extremely gravelly clay, very cobbly clay, or extremely stony clay. The content of clay ranges from 35 to 50 percent. The content of gravel is 5 to 25 percent, the content of cobbles is 0 to 30 percent, and the content of stones is 0 to 60 percent. By sum of cations, base saturation ranges from 35 to 50 percent. Reaction ranges from strongly acid to slightly acid.

Ultic Haploxeralfs, Sandstone

Ultic Haploxeralfs, sandstone, consist of deep or very deep, well drained soils that formed in residuum and colluvium derived from marine sandstone. These soils are on canyon side slopes on Cascade foothills. Slopes range from 3 to 100 percent. The mean annual precipitation is about 48 inches (1,219 mm), and the mean annual air temperature is about 57 degrees F (14 degrees C).

Taxonomic class: Thermic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs, sandstone, very fine sandy loam, on a west-facing slope of 45 percent, under a cover of canyon live oak, blue oak, foothill pine, California laurel, Pacific poison oak, whiteleaf manzanita, and hedgehog dogtail, at an elevation of 980 feet (299 m). When described on 9/24/1998, the soil was dry throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 0.5 inch (0 to 1 cm); slightly decomposed plant material; abrupt smooth boundary.

A—0.5 inch to 2 inches (1 to 5 cm); light brown (7.5YR 6/3) very fine sandy loam, brown (7.5YR 4/3) moist; 14 percent clay; strong fine to coarse granular structure; slightly hard, friable, slightly sticky, nonplastic; many very fine and fine roots; many very fine to medium tubular and irregular pores; 1 percent andesite gravel and 4 percent sandstone gravel; slightly acid, pH 6.6 by Hellige-Truog; gradual wavy boundary.

Bt1—2 to 6 inches (5 to 15 cm); light brown (7.5YR 6/4) very fine sandy loam, brown (7.5YR 4/3) moist; 16 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, nonplastic; common very fine and fine roots; many very fine to medium tubular pores; 30 percent discontinuous faint clay films; 1 percent andesite gravel and 2 percent sandstone gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt2—6 to 11 inches (15 to 28 cm); light brown (7.5YR 6/4) very fine sandy loam, brown (7.5YR 4/4) moist; 18 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine to medium tubular pores; 70 percent discontinuous

distinct clay films; 1 percent sandstone gravel and 1 percent andesite gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt3—11 to 17 inches (28 to 43 cm); light brown (7.5YR 6/4) very fine sandy loam, brown (7.5YR 4/4) moist; 20 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine to medium tubular pores; 90 percent discontinuous distinct clay films; 1 percent andesite gravel and 4 percent sandstone gravel; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

Bt4—17 to 24 inches (43 to 61 cm); light brown (7.5YR 6/4) very fine sandy loam, brown (7.5YR 5/4) moist; 18 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; common very fine and fine roots; many very fine to medium tubular pores; 60 percent discontinuous faint clay films; 2 percent andesite gravel and 8 percent sandstone gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

2Bt5—24 to 32 inches (61 to 81 cm); light brown (7.5YR 6/4) very gravelly very fine sandy loam, brown (7.5YR 4/4) moist; 18 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; common very fine to medium roots; many very fine to medium tubular pores; 60 percent discontinuous faint clay films; 50 percent sandstone gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

2Cr/2Bt—32 to 53 inches (81 to 135 cm); 10 percent brown (7.5YR 5/4) and 90 percent yellow (10YR 7/6) extremely gravelly sandy clay loam, 10 percent brown (7.5YR 4/4) and 90 percent yellowish brown (10YR 5/6) moist; 22 percent clay; moderate fine subangular blocky structure and massive; slightly hard, friable, slightly sticky, slightly plastic; few very fine to medium roots; many very fine to medium tubular pores; 80 percent discontinuous distinct clay films; 30 percent sandstone cobbles and 60 percent sandstone gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt wavy boundary.

2Cr1—53 to 65 inches (135 to 165 cm); pale yellow (2.5Y 7/4), weakly cemented sandstone bedrock, light olive brown (2.5Y 5/4) moist; few very fine to medium roots; few fine irregular pores; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

2Cr2—65 inches (165 cm); pale yellow (2.5Y 7/4), weakly cemented sandstone bedrock, light olive brown (2.5Y 5/4) moist; few very fine roots; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 2 miles southwest of Forest Ranch, approximately 1,700 feet south and 1,600 feet east of the northwest corner of sec. 13, T. 23 N., R. 2 E.; 39 degrees, 51 minutes, 12 seconds north latitude and 121 degrees, 42 minutes, 28 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to paralithic bedrock is 40 to more than 80 inches (102 to 203 cm). The mean annual soil temperature is 59 to 62 degrees F (15 to 17 degrees C). The soil moisture control section is dry in all parts from about June to November (about 150 days). The particle-size control section averages 12 to 30 percent clay and 5 to 30 percent rock fragments, mostly gravel. Rock fragments on the surface range from 0 to 20 percent gravel, 0 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 10YR 6/2, 6/3, or 6/4 or 7.5YR 6/3, 7/4, or 8/4. Moist color is 10YR 4/2, 4/3, 4/4, or 5/4 or 7.5YR 4/3, 4/4, or 5/4. Texture is very fine sandy loam, fine sandy loam, sandy clay loam, or gravelly sandy loam. The content of clay

ranges from 10 to 26 percent. The content of gravel is 3 to 20 percent. Reaction ranges from moderately acid to neutral.

The Bt and 2Bt horizons have dry color of 10YR 5/3, 5/4, 6/2, 6/4, or 7/4 or 7.5YR 5/4 or 6/4. Moist color is 10YR 4/2, 4/3, 5/3, 5/4, or 5/6 or 7.5YR 4/3, 4/4, or 5/4. Texture is very fine sandy loam, very gravelly very fine sandy loam, fine sandy loam, gravelly fine sandy loam, cobbly fine sandy loam, gravelly sandy loam, very gravelly sandy loam, cobbly sandy loam, sandy clay loam, or gravelly sandy clay loam. The content of clay ranges from 10 to 30 percent. The horizons have 1 to 30 percent gravel and 0 to 25 percent cobbles. Reaction ranges from moderately acid to neutral.

Ultic Haploxeralfs, Sandstone, Low Elevation

Ultic Haploxeralfs, sandstone, low elevation, consist of very deep or deep, well drained soils that formed in colluvium and residuum derived from Cretaceous marine sandstone and Eocene sandstone. These soils are on ridgetops and side slopes on Cascade foothills. Slopes range from 2 to 30 percent. The mean annual precipitation is about 31 inches (787 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs, sandstone, low elevation, sandy loam, on an east-facing slope of 5 percent, under a cover of annual grasses, forbs, and scattered blue oaks, at an elevation of 475 feet (145 m). When described on 5/8/2001, the soil was dry to a depth of 8 inches (20 cm) and moist below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); light brown (7.5YR 6/3) sandy loam, brown (10YR 4/3) moist; 16 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, nonplastic; many very fine and fine roots; many fine irregular and tubular pores; 5 percent well rounded mixed gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt wavy boundary.

Bt1—2 to 8 inches (5 to 20 cm); light brown (7.5YR 6/3) sandy clay loam, brown (10YR 4/3) moist; 20 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, slightly sticky, nonplastic; many fine and medium roots between peds and common very fine roots throughout; many medium tubular pores; 15 percent discontinuous distinct clay films on surfaces along root channels; 5 percent well rounded mixed gravel; slightly acid, pH 6.2 by Hellige-Truog; clear wavy boundary.

Bt2—8 to 18 inches (20 to 46 cm); light brown (7.5YR 6/3) sandy clay loam, brown (10YR 4/3) moist; 22 percent clay; moderate coarse subangular blocky structure; hard, firm, slightly sticky, slightly plastic; many fine and medium roots between peds and few very fine roots throughout; many medium tubular pores; 50 percent discontinuous faint clay films on faces of peds; 10 percent well rounded mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

Bt3—18 to 28 inches (46 to 71 cm); light brown (7.5YR 6/4) sandy clay loam, brown (7.5YR 4/4) moist; 25 percent clay; moderate coarse subangular blocky structure; hard, firm, slightly sticky, slightly plastic; few very fine and fine roots throughout and common medium and coarse roots between peds; many medium tubular pores; 50 percent discontinuous distinct clay films on faces of peds; 10 percent well rounded mixed gravel; moderately acid, pH 5.8 by Hellige-Truog; clear wavy boundary.

Bt4—28 to 39 inches (71 to 99 cm); light brown (7.5YR 6/4) sandy clay loam, brown (7.5YR 4/4) moist; 28 percent clay; moderate coarse and very coarse subangular

blocky structure; hard, firm, moderately sticky, moderately plastic; few fine roots throughout and common medium and coarse roots between peds; common fine and medium and tubular pores; 65 percent discontinuous distinct clay films on faces of peds; 10 percent well rounded mixed gravel; moderately acid, pH 5.8 by Hellige-Truog; clear wavy boundary.

BCt—39 to 49 inches (99 to 124 cm); light brown (7.5YR 6/4) sandy clay loam, strong brown (7.5YR 4/6) moist; 26 percent clay; moderate coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; few fine roots throughout and common medium and coarse roots between peds; common very fine and fine irregular and tubular pores; 55 percent discontinuous distinct clay films on faces of peds; 10 percent well rounded mixed gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

C1—49 to 56 inches (124 to 142 cm); reddish yellow (7.5YR 6/6) sandy clay loam, brown (7.5YR 5/6) moist; 22 percent clay; massive; hard, firm, slightly sticky, slightly plastic; few fine to coarse roots in cracks; few very fine irregular pores; 5 percent well rounded mixed gravel; slightly acid, pH 6.2 by Hellige-Truog; abrupt smooth boundary.

C2—56 to 70 inches (142 to 178 cm); brownish yellow (10YR 6/6) sandy loam, yellowish brown (10YR 5/6) moist; 14 percent clay; massive; hard, firm, nonsticky, nonplastic; few fine and medium roots in cracks; few very fine irregular pores; slightly acid, pH 6.5 by Hellige-Truog.

Type location: Butte County, California; about 0.5 mile west of Pentz, approximately 1,100 feet east and 100 feet south of the northwest corner of sec. 25, T. 21 N., R. 3 E.; 39 degrees, 39 minutes, 14 seconds north latitude and 121 degrees, 35 minutes, 38 seconds west longitude; NAD27; USGS Quad: Cherokee, California.

Range in Characteristics

The depth to bedrock is 40 to more than 80 inches (102 to 203 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from about June to November (about 150 days). The particle-size control section averages 20 to 30 percent clay and 0 to 10 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 0 to 5 percent gravel.

The A horizon has dry color of 10YR 6/2 or 6/3 or 7.5YR 6/3. Moist color is 10YR 4/2 or 4/3. Texture is sandy loam, fine sandy loam, or very fine sandy loam. The content of clay ranges from 14 to 20 percent. The content of gravel is 0 to 10 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 6/3 or 6/4. Moist color is 10YR 4/3 or 4/4 or 7.5YR 4/4. Texture is sandy clay loam, gravelly sandy clay loam, sandy clay loam, or clay loam. The content of clay ranges from 20 to 40 percent. The content of gravel is 0 to 20 percent. Reaction is moderately acid or slightly acid.

The BCt horizon has dry color of 7.5YR 6/4 or 10YR 6/4. Moist color is 7.5YR 4/6 or 10YR 5/4. Texture is sandy clay loam, clay loam, loam, fine sandy loam, or very fine sandy loam. The content of clay ranges from 10 to 35 percent. The content of gravel is 0 to 15 percent. Reaction is moderately acid or slightly acid.

The C horizon has dry color of 7.5YR 6/6 or 10YR 6/6. Moist color is 7.5YR 5/4 or 10YR 5/6. Texture is sandy loam or sandy clay loam. The content of clay ranges from 12 to 22 percent. The content of gravel is 0 to 5 percent. Reaction is moderately acid or slightly acid.

Ultic Haploxeralfs, Thermic

Ultic Haploxeralfs, thermic, consist of moderately deep, moderately well drained soils that formed in residuum derived from volcanic rocks. These soils are on ridgetops on Cascade foothills. Slopes range from 3 to 15 percent. The mean annual precipitation is about 30 inches (762 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Loamy-skeletal, mixed, superactive, thermic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs, thermic, gravelly loam, on a southwest-facing slope of 4 percent, under a cover of yellow starthistle and hedgehog dogtail with scattered blue oak, buckbrush, foothill pine, and manzanita, at an elevation of 1,250 feet (381 m). When described on 11/19/1998, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); reddish brown (5YR 5/4) gravelly loam, reddish brown (5YR 4/3) moist; 26 percent clay; weak medium subangular blocky structure parting to moderate fine and medium granular; moderately hard, friable, slightly sticky, slightly plastic; few fine and many very fine roots; many very fine to medium tubular and irregular pores; 5 percent stones, 5 percent cobbles, and 10 percent gravel; slightly acid, pH 6.2 by pH meter 1:1 water; clear smooth boundary.

Bt1—2 to 6 inches (5 to 15 cm); reddish brown (5YR 5/4) very cobbly clay loam, reddish brown (5YR 4/3) moist; 30 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, slightly sticky, slightly plastic; few fine and medium and common very fine roots; common very fine to medium tubular pores; 60 percent continuous distinct clay films on faces of peds; 5 percent stones, 10 percent gravel, and 20 percent cobbles; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

Bt2—6 to 13 inches (15 to 33 cm); reddish brown (5YR 4/4) very cobbly clay loam, reddish brown (5YR 4/3) moist; 34 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, moderately sticky, moderately plastic; common very fine to medium and few coarse roots; many very fine and fine and common medium tubular pores; 80 percent continuous distinct clay films on faces of peds; 10 percent stones, 15 percent gravel, and 30 percent cobbles; moderately acid, pH 6.0 by pH meter 1:1 water; abrupt smooth boundary.

Bt3—13 to 21 inches (33 to 53 cm); yellowish red (5YR 4/6) very cobbly clay loam, reddish brown (5YR 4/4) moist; 33 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; common very fine and fine roots; many very fine and fine and common medium tubular pores; 80 percent continuous distinct clay films on faces of peds; 15 percent stones, 20 percent gravel, and 25 percent cobbles; slightly acid, pH 6.1 by pH meter 1:1 water; abrupt smooth boundary.

Bt4—21 to 31 inches (53 to 79 cm); yellowish red (5YR 4/6) very cobbly clay loam, reddish brown (5YR 4/4) moist; 31 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, very sticky, moderately plastic; common very fine and fine roots; many very fine and fine and common medium tubular pores; 90 percent continuous distinct clay films on faces of peds; 10 percent stones, 20 percent gravel, and 25 percent cobbles; slightly acid, pH 6.4 by pH meter 1:1 water; abrupt wavy boundary.

R—31 inches (79 cm); strongly cemented volcanic conglomerate bedrock; platy iron-manganese concretions at the top of the horizon.

Type location: Butte County, California; about 1.05 miles north of the intersection of the upper end of Humboldt Road and Highway 32 and 200 feet west of Highway 32, approximately 2,400 feet east and 150 feet north of the center of sec. 10, T. 22 N., R. 2 E.; 39 degrees, 46 minutes, 39 seconds north latitude and 121 degrees, 43 minutes, 58 seconds west longitude; NAD83; USGS Quad: Paradise West, California.

Range in Characteristics

The depth to lithic or paralithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 59 to 67 degrees F (15 to 19 degrees C). The soil moisture control section is dry in all parts from about June to October (about 150 days). The particle-size control section averages 22 to 35 percent clay and 35 to 70 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur between the top of the bedrock and 18 inches (46 cm) below the surface of the soil from December through March. Redoximorphic features occur as oxidized iron masses and iron-manganese masses in the A horizon and as a manganese capping on the R or Cr horizon. Rock fragments on the surface range from 5 to 20 percent gravel, 0 to 80 percent cobbles, 0 to 10 percent stones, and 0 to 10 percent boulders.

The A horizon has dry color of 5YR 5/4, 6/4, or 6/6 or 7.5YR 6/4. Moist color is 5YR 4/3 or 4/4 or 7.5YR 4/2 or 4/3. Texture is gravelly or cobbly loam. The content of clay ranges from 18 to 27 percent. The horizon has 10 to 25 percent gravel, 0 to 15 percent cobbles, and 0 to 5 percent stones. By sum of cations, base saturation ranges from 55 to 70 percent. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 5YR 4/4, 4/6, 5/4, or 5/6; 7.5YR 5/3, 5/4, or 6/4; or 10YR 5/4. Moist color is 5YR 4/3 or 4/4 or 7.5YR 4/3 or 4/4. Texture is gravelly loam, very gravelly loam, extremely gravelly loam, cobbly loam, very cobbly loam, very cobbly clay loam, or extremely cobbly clay loam. The content of clay ranges from 20 to 39 percent. The horizon has 10 to 40 percent gravel, 0 to 40 percent cobbles, and 0 to 15 percent stones. By sum of cations, base saturation ranges from 50 to 80 percent. Reaction ranges from moderately acid to neutral.

Ultic Haploxeralfs, Thermic, High Terrace

Ultic Haploxeralfs, thermic, high terrace, consist of very deep, moderately well drained soils that formed in alluvium derived from igneous and metamorphic rocks. These soils are on old, highly dissected, high terraces. Slopes range from 2 to 30 percent. The mean annual precipitation is about 29 inches (737 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Thermic Ultic Haploxeralfs

Typical Pedon

Ultic Haploxeralfs, thermic, high terrace, loam, on a slope of 30 percent, under a cover of blue oak, foothill pine, annual grasses, and forbs, at an elevation of 660 feet (201 m). When described on 4/27/2002, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (10YR 5/3) loam, dark brown (10YR 3/3) moist; 17 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 2 percent subrounded quartz gravel and 8 percent subrounded metavolcanic gravel; 10 percent fine irregular yellowish red (5YR 5/8 moist) oxidized iron masses throughout; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

BAt—2 to 6 inches (5 to 15 cm); yellowish brown (10YR 5/4) gravelly loam, dark yellowish brown (10YR 3/4) moist; 20 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine and common medium tubular pores; 5 percent subrounded quartz gravel and 25 percent subrounded metavolcanic gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt1—6 to 12 inches (15 to 30 cm); yellowish brown (10YR 5/4) very gravelly loam, dark yellowish brown (10YR 3/4) moist; 23 percent clay; moderate fine and medium subangular blocky structure; slightly hard, friable, slightly sticky, slightly plastic; many very fine roots; many very fine and fine tubular pores; 5 percent subrounded quartz gravel, 35 percent subrounded metavolcanic gravel, and 10 percent subrounded metavolcanic cobbles; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt2—12 to 20 inches (30 to 51 cm); light yellowish brown (10YR 6/4) very gravelly loam, dark yellowish brown (10YR 4/4) moist; 26 percent clay; strong medium subangular blocky structure; moderately hard, firm, moderately sticky, moderately plastic; many very fine roots; many very fine and fine tubular pores; 5 percent subrounded quartz gravel, 10 percent subrounded metavolcanic cobbles, and 25 percent subrounded metavolcanic gravel; strongly acid, pH 5.5 by Hellige-Truog; clear smooth boundary.

Bt3—20 to 32 inches (51 to 81 cm); light yellowish brown (10YR 6/4) extremely gravelly clay loam, yellowish brown (10YR 5/4) moist; 29 percent clay; strong medium subangular blocky structure; moderately hard, firm, moderately sticky, moderately plastic; few medium and many very fine roots; many very fine and fine tubular pores; 5 percent subrounded quartz gravel, 10 percent subrounded metavolcanic cobbles, and 60 percent subrounded metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; abrupt smooth boundary.

Bq1—32 to 39 inches (81 to 99 cm); very pale brown (10YR 7/4) extremely gravelly loam, light yellowish brown (10YR 6/4) moist; 26 percent clay; moderate fine subangular blocky structure; slightly hard, friable, moderately sticky, moderately plastic; accumulation of secondary silica; many very fine roots; many very fine and fine tubular pores; 1 percent fine irregular yellowish red (5YR 5/8 moist) oxidized iron masses around rock fragments; 5 percent subrounded quartz gravel, 10 percent subrounded metavolcanic cobbles, and 50 percent subrounded metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog; clear smooth boundary.

Bq2—39 to 50 inches (99 to 127 cm); light yellowish brown (10YR 6/4) extremely gravelly sandy clay loam, yellowish brown (10YR 5/4) moist; 23 percent clay; moderate very fine and fine subangular blocky structure; soft, very friable, slightly sticky, slightly plastic; accumulation of secondary silica; common very fine and fine and few medium roots around rock fragments; common very fine and fine tubular pores; 10 percent fine irregular yellowish red (5YR 5/8 moist) oxidized iron masses around rock fragments; 5 percent subrounded quartz gravel, 15 percent subrounded metavolcanic cobbles, and 60 percent subrounded metavolcanic gravel; slightly acid, pH 6.3 by Hellige-Truog.

Type location: Butte County, California; about 2.35 miles northwest of Bangor, approximately 1,350 feet south and 2,100 feet west of the northeast corner of sec. 20, T. 18 N., R. 5 E.; 39 degrees, 24 minutes, 21.58 seconds north latitude and 121 degrees, 25 minutes, 59.60 seconds west longitude; NAD83; USGS Quad: Bangor, California.

Range in Characteristics

Depth to the Bq horizon is 20 to 60 inches (51 to 152 cm) or more. The thickness of the solum is more than 60 inches (152 cm). The mean annual soil temperature is

59 to 65 degrees F (15 to 18 degrees C). The soil moisture control section is dry in all parts from about June through October (about 150 days). The particle-size control section averages 25 to 37 percent clay and 5 to 65 percent rock fragments, mostly gravel. Mineralogy is mixed. Redoximorphic features, such as oxidized iron masses and spherical manganese concretions, can occur in all horizons. A fluctuating water table can occur at a depth of 10 to 60 inches (25 to 152) from December through March. Some pedons have a BCt or C horizon.

The A horizon has dry color of 10YR 5/3, 5/4, or 6/4. Moist color is 10YR 3/3 or 3/4 or 7.5YR 3/3 or 4/3. Texture is loam, gravelly loam, or gravelly sandy loam. The content of clay ranges from 14 to 17 percent. The content of gravel is 10 to 30 percent. The content of organic matter is 1.0 to 3.5 percent. Reaction ranges from strongly acid to slightly acid.

The BAt horizon has dry color of 10YR 5/4, 5/6, or 6/3 or 7.5YR 5/4. Moist color is 10YR 3/4, 7.5YR 4/3 or 4/4, or 5YR 4/4. Texture is gravelly loam or very gravelly sandy loam. The content of clay ranges from 18 to 20 percent. The horizon has 15 to 45 percent gravel and 0 to 15 percent cobbles. The content of organic matter is 1.0 to 1.5 percent. Reaction is strongly acid or moderately acid.

The upper part of the Bt horizon has dry color of 10YR 5/3, 5/4, or 6/4 or 7.5YR 6/4. Moist color is 10YR 3/4 or 4/3, 7.5YR 4/4, or 5YR 4/4. Texture is loam, very gravelly loam, cobbly clay loam, very gravelly sandy clay loam, or gravelly sandy loam. The content of clay ranges from 20 to 30 percent. The content of gravel is 15 to 50 percent, and the content of cobbles is 0 to 15 percent. The content of organic matter is 0.5 to 1.0 percent. Reaction is strongly acid or moderately acid.

The lower part of the Bt horizon has dry color of 10YR 6/4; 7.5YR 6/4, 6/6, or 7/4; or 5YR 5/6. Moist color is 10YR 4/3; 7.5YR 4/4, 5/4, or 5/6; or 5YR 4/4 or 4/6. Texture is very gravelly loam, gravelly clay loam, very gravelly clay loam, extremely gravelly clay loam, cobbly clay loam, gravelly sandy clay loam, or very gravelly sandy clay loam. The content of clay ranges from 26 to 37 percent. The content of gravel is 15 to 65 percent, and the content of cobbles is 0 to 10 percent. The content of organic matter is 0.2 to 0.5 percent. Reaction ranges from strongly acid to slightly acid.

The Bq horizon has dry color of 10YR 5/4, 6/4, or 7/4. Moist color is 10YR 4/3, 4/4, 5/4, or 6/4. Texture is extremely gravelly loam or extremely gravelly sandy clay loam. The content of clay ranges from 20 to 26 percent. The horizon has 50 to 85 percent gravel and 0 to 15 percent cobbles. The content of organic matter is 0.1 to 0.5 percent. Reaction is slightly acid or neutral.

Vermet Series

The Vermet series consists of very deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in channels on flood plains. Slopes range from 0 to 2 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 63 degrees F (17 degrees C).

Taxonomic class: Fine-silty, mixed, superactive, thermic Aquic Haploxerepts

Typical Pedon

Vermet silt loam, on a slope of less than 1 percent, under a cover of annual grasses and forbs, at an elevation of 103 feet (31 m). When described on 6/27/1997, the soil was dry to a depth of 16 inches (41 cm) and slightly moist from 16 to 72 inches (41 to 183 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 2 inches (0 to 5 cm); light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; 18 percent clay; strong very thin platy structure parting to moderate fine subangular blocky; slightly hard, very friable, nonsticky, slightly

plastic; common very fine roots; few fine irregular and few very fine tubular pores; 2 percent very fine irregular strong brown (7.5YR 4/6) oxidized iron masses; 1 percent well rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

A2—2 to 8 inches (5 to 20 cm); light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; 20 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; common very fine roots; few very fine tubular pores; 5 percent very fine irregular strong brown (7.5YR 4/6) oxidized iron masses; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

A3—8 to 13 inches (20 to 33 cm); pale brown (10YR 6/3) silt loam, brown (10YR 4/3) moist; 22 percent clay; moderate fine subangular blocky structure; slightly hard, friable, nonsticky, slightly plastic; few very fine roots; common very fine and fine tubular pores; 5 percent very fine irregular strong brown (7.5YR 4/6) oxidized iron masses; neutral, pH 6.8 by Hellige-Truog; clear smooth boundary.

Bw1—13 to 16 inches (33 to 41 cm); pale brown (10YR 6/3) silty clay loam, grayish brown (10YR 5/2) moist; 29 percent clay; moderate fine subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few very fine roots; common very fine tubular pores; 5 percent discontinuous faint silt coatings; 10 percent very fine irregular brown (7.5YR 4/4) oxidized iron masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bw2—16 to 26 inches (41 to 66 cm); pale brown (10YR 6/3) silty clay loam, brown (10YR 4/3) moist; 30 percent clay; moderate medium subangular blocky structure; slightly hard, friable, slightly sticky, moderately plastic; few very fine roots; common very fine tubular pores; 5 percent discontinuous faint silt coatings; 10 percent very fine irregular brown (7.5YR 4/4) oxidized iron masses; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bw3—26 to 41 inches (66 to 104 cm); pale brown (10YR 6/3) silty clay loam, brown (10YR 5/3) moist; 32 percent clay; moderate medium subangular blocky structure; hard, friable, slightly sticky, moderately plastic; common very fine tubular pores; 5 percent discontinuous faint silt coatings; 10 percent very fine irregular brown (7.5YR 4/4) oxidized iron masses and 10 percent very fine threadlike gray (10YR 6/1) iron depletions lining pores; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bw4—41 to 62 inches (104 to 157 cm); light yellowish brown (10YR 6/4) silty clay loam, brown (10YR 5/3) moist; 32 percent clay; moderate medium subangular blocky structure; hard, firm, slightly sticky, moderately plastic; few very fine tubular pores; 5 percent discontinuous faint silt coatings; 10 percent very fine irregular brown (7.5YR 4/4) oxidized iron masses and 10 percent very fine threadlike gray (10YR 6/1) iron depletions lining pores; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Bw5—62 to 72 inches (157 to 183 cm); very pale brown (10YR 7/4) silty clay loam, yellowish brown (10YR 5/4) moist; 33 percent clay; moderate medium subangular blocky structure; hard, firm, slightly sticky, moderately plastic; few very fine tubular pores; 5 percent discontinuous faint silt coatings; 5 percent very fine irregular brown (7.5YR 4/4) oxidized iron masses, 5 percent very fine threadlike gray (10YR 6/1) iron depletions lining pores, and 5 percent very fine irregular black (N 2/0) manganese masses; 1 percent well rounded gravel; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

Type location: Butte County, California; about 0.76 mile north of the Rancho Llano Seco headquarters, approximately 200 feet east of entrance road and 2 miles west of the Mt. Diablo meridian; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 37 minutes, 10 seconds north latitude and 121 degrees, 57 minutes, 10 seconds west longitude; NAD27; USGS Quad: Llano Seco, California.

Range in Characteristics

The soils are more than 60 inches (152 cm) deep. The mean annual soil temperature is 60 to 64 degrees F (16 to 18 degrees C). The particle-size control section averages 27 to 35 percent clay and more than 50 percent silt. Mineralogy is mixed. By ammonium acetate, base saturation ranges from 90 to 100 percent throughout the profile. A fluctuating water table can occur within a depth of 40 inches (102 cm) from December through April and usually is below a depth of 40 inches (102 cm) from May through November. Redoximorphic features range from 2 to 20 percent oxidized iron masses with color of 7.5YR 4/4 or 4/6 from a depth of 0 to 80 inches (0 to 203 cm) or more, 5 to 15 percent soft manganese masses with color of N 2/0 from a depth of 20 to 80 inches (51 to 203 cm) or more, and 5 to 20 percent iron depletions with color of 10YR 6/1, 5Y 4/1, or 5BG 5/1 beginning at a depth of 20 to 30 inches (51 to 76 cm) and extending to a depth of 80 inches (203 cm) or more. Rock fragments on the surface range from 0 to 20 percent gravel. Some pedons may have calcium carbonates in the lower part and/or a gravelly substratum below a depth of 40 inches (102 cm) and/or have a C horizon.

The A horizon has dry color of 10YR 6/2 or 6/3. Moist color is 10YR 4/2, 4/3, 5/2, or 5/3. Texture is silt loam or gravelly silt loam. The content of clay ranges from 18 to 25 percent. The content of gravel is 0 to 20 percent. The content of organic matter is 1 to 5 percent. Reaction ranges from slightly acid to slightly alkaline.

The Bw horizon has dry color of 10YR 6/3, 6/4, or 7/4 or 2.5Y 5/2, 6/2, 7/4, or 8/3. Moist color is 10YR 4/3, 5/2, or 5/3; 2.5Y 5/3 or 5/4; or 7.5YR 5/3. Texture is silty clay loam or clay loam. The content of clay ranges from 29 to 35 percent in the upper part of the horizon and from 30 to 40 percent in the lower part. The content of organic matter is 0.2 to 2 percent. Reaction ranges from neutral to moderately alkaline.

The C horizon, where it occurs, has dry color of 10YR 7/3 or 8/3 or 2.5Y 7/3. Moist color is 10YR 4/3, 5/3, or 5/4 or 2.5Y 5/3. Texture is sandy loam, very fine sandy loam, or silt loam. The content of clay ranges from 13 to 20 percent. Reaction is slightly alkaline or moderately alkaline.

Vina Series

The Vina series consists of very deep, well drained soils that formed in alluvium derived from mixed rock sources. These soils are on alluvial fans. Slopes are 0 to 1 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 62 degrees F (17 degrees C).

Taxonomic class: Coarse-loamy, mixed, superactive, thermic Pachic Haploxerolls

Typical Pedon

Vina fine sandy loam, on a slope of 0.5 percent, under a cover of almond trees, at an elevation of 148 feet (45 m). When described on 5/25/1994, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

Ap1—0 to 3 inches (0 to 8 cm); grayish brown (10YR 5/2) fine sandy loam, very dark grayish brown (10YR 3/2) moist; 13 percent clay; strong thick platy structure parting to strong thin and medium platy; soft, friable, nonsticky, slightly plastic; common very fine and fine roots; common very fine and fine and few medium tubular pores; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt smooth boundary.

Ap2—3 to 11 inches (8 to 28 cm); brown (10YR 5/3) fine sandy loam, very dark grayish brown (10YR 3/2) moist; 15 percent clay; moderate fine and medium subangular blocky structure; soft, friable, nonsticky, slightly plastic; few fine and

medium roots; common fine and medium tubular pores; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

A1—11 to 23 inches (28 to 58 cm); brown (10YR 5/3) sandy loam, very dark grayish brown (10YR 3/2) moist; 13 percent clay; weak fine and medium subangular blocky structure; soft, very friable, nonsticky, slightly plastic; common fine and medium, few coarse, and few very fine roots; common fine and medium and few very fine tubular pores; 2 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; clear wavy boundary.

A2—23 to 37 inches (58 to 94 cm); brown (10YR 5/3) sandy loam, brown (7.5YR 4/2) moist; 11 percent clay; weak and moderate fine and medium subangular blocky structure; soft, very friable, nonsticky, slightly plastic; few fine to coarse roots; many fine and medium and few very fine tubular pores; 4 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

C1—37 to 50 inches (94 to 127 cm); brown (10YR 5/3) sandy loam, brown (7.5YR 4/2) moist; 7 percent clay; massive; soft, very friable, nonsticky, nonplastic; few fine and medium roots; common fine and few medium tubular pores; 4 percent gravel; slightly alkaline, pH 7.5 by Hellige-Truog; clear wavy boundary.

C2—50 to 54 inches (127 to 137 cm); brown (10YR 5/3) loamy coarse sand, dark brown (7.5YR 3/2) moist; 5 percent clay; single grain; soft, very friable, nonsticky, nonplastic; many fine irregular pores; neutral, pH 7.0 by Hellige-Truog; abrupt wavy boundary.

C3—54 to 80 inches (137 to 203 cm); light brownish gray (10YR 6/2) coarse sand, very dark grayish brown (10YR 3/2) moist; 3 percent clay; single grain; loose, nonsticky, nonplastic; many fine irregular pores; 2 percent gravel; neutral, pH 7.0 by Hellige-Truog.

Type location: Butte County, California; about 2 miles west of Chico, approximately 3,250 feet east of Meridian Avenue and 1,650 feet south of Sacramento Avenue; in an unsectionized area in the Arroyo Chico Land Grant; 39 degrees, 43 minutes, 32 seconds north latitude and 121 degrees, 54 minutes, 24 seconds west longitude; NAD27; USGS Quad: Ord Ferry, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm). The mean annual soil temperature is 60 to 62 degrees F (16 to 17 degrees C). The particle-size control section averages 12 to 18 percent clay and 50 to 65 percent sand. Mineralogy is mixed. The content of organic matter is 1 to 2.5 percent to a depth of 23 inches (56 cm). By ammonium acetate, base saturation is 100 percent to a depth of 23 inches (56 cm).

The Ap horizon has dry color of 10YR 4/3, 5/2, or 5/3. Moist color is 10YR 3/1, 3/2, or 3/3 or 7.5YR 3/2. Texture is fine sandy loam or loam. The content of clay ranges from 12 to 20 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to moderately alkaline.

The A horizon has dry color of 10YR 4/2, 4/3, 5/2, or 5/3. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/2. Texture is fine sandy loam, sandy loam, or loam. The content of clay ranges from 5 to 18 percent. The content of gravel is 0 to 5 percent. Reaction ranges from slightly acid to moderately alkaline.

The Bw horizon, where it occurs, has dry color of 10YR 5/3, 6/2, or 6/3. Moist color is 10YR 4/2 or 4/3 or 7.5YR 4/2 or 4/3. Texture is loam, fine sandy loam, or sandy loam. The content of clay ranges from 5 to 18 percent. The content of gravel is 0 to 5 percent. Reaction ranges from neutral to moderately alkaline.

The C horizon has dry color of 10YR 4/3, 5/2, 5/3, or 6/2. Moist color is 10YR 3/2, 3/3, or 4/2 or 7.5YR 3/2, 3/3, or 4/2. Texture is fine sandy loam, loam, sandy loam, loamy sand, loamy coarse sand, or coarse sand. The content of clay ranges from 1 to

15 percent. The content of gravel is 0 to 5 percent. Reaction ranges from neutral to moderately alkaline.

Vistarobles Series

The Vistarobles series consists of shallow, somewhat poorly drained soils that formed in alluvium derived from igneous and metamorphic rocks. These soils are in swales on intermediate terraces. Slopes range from 0 to 9 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Clayey, mixed, active, thermic, shallow Abruptic Durixeralfs

Typical Pedon

Vistarobles sandy loam, on a south-facing slope of less than 1 percent, under a cover of navarretia, coyote thistle, and blow wives, at an elevation of 100 feet (30 m). When described on 5/13/1992, the soil was moist below a depth of 6 inches (15 cm). (Colors are for dry soil unless otherwise noted.)

A1—0 to 5 inches (0 to 13 cm); strong brown (7.5YR 5/6) sandy loam, dark brown (7.5YR 3/4) moist; 17 percent clay; weak thick platy structure parting to moderate medium subangular blocky; hard, friable, slightly sticky, slightly plastic; few very fine and fine roots; many very fine irregular and tubular pores; 5 percent fine distinct light brownish gray (10YR 6/2) oxidized iron masses and 2 percent fine distinct black (N 2/0) manganese masses; 5 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

A2—5 to 10 inches (13 to 25 cm); strong brown (7.5YR 5/6) sandy clay loam, brown (7.5YR 4/4) moist; 20 percent clay; moderate fine and medium subangular blocky structure; hard, friable, slightly sticky, slightly plastic; few very fine roots; many very fine irregular and tubular pores; 10 percent fine distinct strong brown (7.5YR 5/8) oxidized iron masses and 2 percent fine distinct black (N 2/0) manganese masses; 10 percent gravel; neutral, pH 6.8 by Hellige-Truog; abrupt smooth boundary.

2Bt—10 to 14 inches (25 to 36 cm); strong brown (7.5YR 5/6) gravelly clay, dark brown (7.5YR 3/4) moist; 40 percent clay; moderate medium angular blocky structure; very hard, friable, moderately sticky, moderately plastic; many very fine irregular and tubular pores; 2 percent fine distinct black (N 2/0) manganese masses; 50 percent discontinuous prominent clay films on faces of peds; 25 percent gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

3Bqm—14 to 34 inches (36 to 86 cm); reddish yellow (7.5YR 6/6), indurated duripan, strong brown (7.5YR 4/6) moist; cemented by silica; cementation decreasing with increasing depth; 25 percent gravel and 5 percent cobbles; 15 percent manganese surface coatings on top of the duripan; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

3C—34 to 40 inches (86 to 102 cm); dark yellowish brown (10YR 4/6) very cobbly sandy loam, dark yellowish brown (10YR 4/4) moist; 14 percent clay; single grain; loose, nonsticky, nonplastic; many very fine irregular pores; 15 percent gravel and 20 percent cobbles; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 3.2 miles northwest of Honcut, approximately 1,800 feet east and 300 feet south of the northwest corner of sec. 6, T. 17 N., R. 4 E.; 39 degrees, 21 minutes, 50 seconds north latitude and 121 degrees, 34 minutes, 9 seconds west longitude; NAD27; USGS Quad: Honcut, California.

Range in Characteristics

Depth to the duripan is 10 to 20 inches (25 to 51 cm). The mean annual soil temperature is 61 to 65 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about May 15 to October 31 (about 150 days). The particle-size control section averages 36 to 50 percent clay and 3 to 25 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur from the top of the duripan to 16 inches (41 cm) below the surface of the soil from November through April. Rock fragments on the surface range from 0 to 15 percent gravel and 0 to 5 percent cobbles. Some pedons have a BA, Bt, or 2BCt horizon and/or have iron depletions in the 2Bt horizon.

The A horizon has dry color of 7.5YR 5/4, 5/6, 5/8, or 6/4 or 10YR 4/4, 5/2, or 5/4. Moist color is 7.5YR 3/2, 3/4, or 4/4; 5YR 3/4; or 10YR 3/4. Texture is loam, gravelly loam, sandy loam, gravelly sandy loam, or sandy clay loam. The content of clay ranges from 16 to 26 percent. The horizon has 5 to 20 percent gravel and 0 to 10 percent cobbles. The content of organic matter is 1 to 2 percent. By sum of cations, base saturation ranges from 65 to 75 percent. Redoximorphic features, such as oxidized iron-manganese masses with dry color of 7.5YR 5/6 or 5/8 or 10YR 5/4, 5/8, 6/2, or 7/3 and manganese masses with dry color of N 2/0, occur in this horizon. Reaction ranges from strongly acid to neutral.

The 2Bt horizon has dry color of 7.5YR 5/4, 5/6, or 6/6. Moist color is 7.5YR 3/4, 4/4, or 4/6 or 5YR 4/6. Texture is clay or gravelly clay. The content of clay ranges from 40 to 50 percent. The content of gravel is 0 to 25 percent. The content of organic matter is 0.4 to 1.0 percent. By sum of cations, base saturation ranges from 75 to 85 percent. Redoximorphic features, such as soft oxidized iron masses with dry color of 7.5YR 4/4 and manganese masses with dry color of N 2.5/0, occur in this horizon. Reaction is slightly acid or neutral.

The 3Bqm horizon has dry color of 7.5YR 5/8 or 6/6. Moist color is 7.5YR 4/6 or 5/6. The horizon has 20 to 60 percent gravel and 1 to 15 percent cobbles. Reaction ranges from neutral to moderately alkaline.

The 3C horizon has dry color of 10YR 4/6 or 6/4. Moist color is 10YR 4/4 or 5/4 or 7.5YR 4/6 or 5/6. Texture is very cobbly loamy sand, very gravelly loamy sand, very gravelly loamy coarse sand, very cobbly sandy loam, very gravelly sandy loam, very cobbly coarse sandy loam, or very gravelly coarse sandy loam. The content of clay ranges from 3 to 15 percent. The horizon has 15 to 60 percent gravel and 0 to 25 percent cobbles. Reaction ranges from neutral to moderately alkaline.

Wafap Series

The Wafap series consists of deep, somewhat poorly drained soils that formed in alluvium derived from volcanic rocks. These soils are on bars on low stream terraces. Slopes range from 0 to 2 percent. The mean annual precipitation is about 26 inches (660 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Clayey-skeletal, mixed, superactive, thermic Oxyaquic Argixerolls

Typical Pedon

Wafap gravelly loam, on a west-facing slope of 1 percent, under a cover of filaree and soft chess, at an elevation of 312 feet (95 m). When described on 4/2/1997, the soil was dry to a depth of 1 inch (3 cm), very slightly moist from 1 to 5 inches (3 to 13 cm), and slightly moist from 5 to 46 inches (13 to 117 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 1 inch (0 to 3 cm); brown (7.5YR 5/3) gravelly loam, dark reddish brown (5YR 3/3) moist; 22 percent clay; moderate medium platy structure parting to strong fine and medium subangular blocky; very hard, firm, slightly sticky, slightly plastic; many very fine roots; common very fine vesicular and tubular pores; 10 percent cobbles and 20 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; clear smooth boundary.

Bt1—1 to 5 inches (3 to 13 cm); brown (7.5YR 4/3) cobbly clay loam, dark reddish brown (5YR 3/2) moist; 28 percent clay; moderate coarse columnar structure parting to strong medium subangular blocky; extremely hard, firm, slightly sticky, moderately plastic; common very fine roots around rock fragments; common very fine vesicular and tubular pores; 70 percent continuous distinct clay films on faces of peds; 15 percent cobbles and 15 percent gravel; neutral, pH 6.7 by Hellige-Truog; gradual smooth boundary.

Bt2—5 to 13 inches (13 to 33 cm); brown (7.5YR 4/3) very cobbly clay loam, dark reddish brown (5YR 3/2) moist; 36 percent clay; moderate medium subangular blocky structure; very hard, friable, moderately sticky, moderately plastic; common very fine roots; common fine and very fine vesicular and tubular pores; 80 percent continuous distinct clay films on faces of peds; 5 percent stones, 10 percent gravel, and 25 percent cobbles; neutral, pH 7.0 by Hellige-Truog; clear wavy boundary.

Bt3—13 to 32 inches (33 to 81 cm); brown (7.5YR 4/4) extremely cobbly clay loam, reddish brown (5YR 4/3) moist; 39 percent clay; moderate fine and medium subangular blocky structure; very hard, friable, very sticky, very plastic; common very fine roots; common very fine vesicular and tubular pores; 90 percent continuous distinct clay films on faces of peds and rock fragments; 5 percent stones, 25 percent gravel, and 50 percent cobbles; slightly alkaline, pH 7.5 by Hellige-Truog; clear wavy boundary.

Bt4—32 to 39 inches (81 to 99 cm); brown (7.5YR 5/4) extremely cobbly clay loam, brown (7.5YR 4/4) moist; 38 percent clay; moderate fine and medium subangular blocky structure; moderately hard, friable, very sticky, very plastic; few very fine roots; common very fine vesicular and tubular pores; 90 percent continuous distinct clay films on faces of peds and rock fragments; 5 percent stones, 30 percent gravel, and 50 percent cobbles; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

Btq—39 to 46 inches (99 to 117 cm); light yellowish brown (10YR 6/4) extremely gravelly sandy clay loam, brown (7.5YR 5/4) moist; 30 percent clay; moderate fine subangular blocky structure; slightly hard, firm, weakly cemented by silica, moderately sticky, moderately plastic; common very fine vesicular and tubular pores; 90 percent continuous distinct clay films on faces of peds and rock fragments; 5 percent stones, 35 percent cobbles, and 40 percent gravel; moderately alkaline, pH 8.0 by Hellige-Truog; abrupt wavy boundary.

2Bqm—46 inches (117 cm); indurated duripan; cemented by silica.

Type location: Butte County, California; about 1.5 miles north of Rock Creek Road and 2.4 miles east of Meridian Road, approximately 2,050 feet north and 2,150 feet east of the southwest corner of sec. 9, T. 23 N., R. 1 E.; 39 degrees, 51 minutes, 40 seconds north latitude and 121 degrees, 52 minutes, 22 seconds west longitude; NAD27; USGS Quad: Richardson Springs, California.

Range in Characteristics

Depth to the duripan is 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 68 degrees F (17 to 20 degrees C). The particle-size control section averages 35 to 40 percent clay and 35 to 60 percent rock fragments, mostly gravel. Mineralogy is mixed. A fluctuating water table can occur between the top of the duripan and 13 inches below the surface of the soil from December through April. Redoximorphic features occur as oxidized iron masses in the A horizon and in the

upper part of the Bt horizon and as iron-manganese masses in the lower part of the Bt horizon and in the Btq horizon. Rock fragments on the surface range from 0 to 5 percent gravel, 0 to 5 percent cobbles, and 0 to 2 percent stones. Some pedons do not have a Btq horizon. Some have a 2Bt horizon.

The A horizon has dry color of 7.5YR 4/3 or 5/3 or 5YR 5/2. Moist color is 7.5YR 3/2 or 3/3 or 5YR 3/2 or 3/3. Texture is loam, gravelly loam, or very gravelly sandy clay loam. The content of clay ranges from 16 to 26 percent. The horizon has 10 to 45 percent gravel and 0 to 10 percent cobbles. Reaction is slightly acid or neutral.

The upper part of the Bt horizon has dry color of 7.5YR 4/3, 5/3, or 6/3 or 5YR 5/3. Moist color is 7.5YR 3/3 or 4/2 or 5YR 3/2 or 3/3. Texture is loam, gravelly loam, cobbly loam, gravelly clay loam, cobbly clay loam, or very gravelly sandy clay loam. The content of clay ranges from 22 to 35 percent. The content of gravel is 10 to 30 percent, and the content of cobbles is 0 to 15 percent. Reaction is slightly acid or neutral.

The lower part of the Bt horizon has dry color of 7.5YR 4/3, 4/4, 5/3, 5/4, 6/3, or 6/4 or 5YR 5/3. Moist color is 7.5YR 3/2, 4/2, 4/3, or 4/4 or 5YR 3/2, 3/3, or 4/3. Texture is gravelly clay loam, very gravelly clay loam, very cobbly clay loam, extremely cobbly clay loam, very gravelly sandy clay loam, extremely gravelly sandy clay loam, very gravelly sandy clay, or very gravelly clay. The content of clay ranges from 30 to 45 percent. The content of gravel is 10 to 70 percent, the content of cobbles is 5 to 60 percent, and the content of stones is 0 to 5 percent. Reaction ranges from neutral to moderately alkaline.

The Btq horizon has dry color of 7.5YR 5/4 or 10YR 6/4. Moist color is 7.5YR 4/3 or 5/4 or 5YR 3/4. Texture is extremely gravelly sandy clay loam, extremely gravelly sandy clay, extremely cobbly sandy clay loam, or extremely cobbly sandy clay. The content of clay ranges from 20 to 40 percent. The horizon has 35 to 70 percent gravel, 30 to 60 percent cobbles, and 0 to 5 percent stones. Reaction ranges from neutral to moderately alkaline.

Walkermine Series

The Walkermine series consists of very shallow or shallow, well drained soils that formed in colluvium and residuum derived from metavolcanic and metasedimentary rocks. These soils are on ridgetops and side slopes on metamorphic Sierra Nevada mountains. Slopes range from 3 to 110 percent. The mean annual precipitation is about 72 inches (1,829 mm), and the mean annual air temperature is about 50 degrees F (10 degrees C).

Taxonomic class: Loamy-skeletal, mixed, active, mesic Lithic Dystroxerepts

Typical Pedon

Walkermine very gravelly loam, on a west-facing slope of 68 percent, under a cover of canyon live oak, California black oak, and bigleaf maple with some white fir, sugar pine, Douglas-fir, ponderosa pine, and incense cedar, at an elevation of 4,500 feet (1,372 m). When described on 10/15/1999, the soil was slightly moist throughout. (Colors are for dry soil unless otherwise noted.)

Oi—0 to 1 inch (0 to 3 cm); slightly decomposed plant material; abrupt smooth boundary.

A—1 to 3 inches (3 to 8 cm); light yellowish brown (10YR 6/4) very gravelly loam, brown (7.5YR 4/2) moist; 22 percent clay; moderate fine granular structure; slightly hard, friable, nonsticky, slightly plastic; common very fine and fine roots; many very fine and fine and common medium vesicular and tubular pores; 15 percent cobbles and 45 percent gravel; slightly acid, pH 6.5 by Hellige-Truog; NaF pH 9.0; clear smooth boundary.

Bt—3 to 12 inches (8 to 30 cm); light brown (7.5YR 6/4) very gravelly loam, brown (7.5YR 4/4) moist; 23 percent clay; moderate fine and medium subangular blocky structure parting to moderate fine granular; moderately hard, friable, nonsticky, slightly plastic; common fine and medium roots; many very fine and fine and common medium vesicular and tubular pores; 90 percent continuous faint clay bridges between sand grains; 20 percent cobbles and 40 percent gravel; moderately acid, pH 6.0 by Hellige-Truog; NaF pH 9.2; abrupt smooth boundary.
R—12 inches (30 cm); indurated metavolcanic bedrock.

Type location: Butte County, California; about 2.85 miles east of Lomo, approximately 1,320 feet north and 900 feet west of the southeast corner of sec. 7, T. 25 N., R. 4 E.; 40 degrees, 2 minutes, 6 seconds north latitude and 121 degrees, 33 minutes, 51 seconds west longitude; NAD83; USGS Quad: Butte Meadows, California.

Range in Characteristics

The depth to lithic bedrock is 4 to 20 inches (10 to 51 cm). The mean annual soil temperature is 47 to 57 degrees F (8 to 14 degrees C). The particle-size control section averages 15 to 27 percent clay and 35 to 80 percent rock fragments, mostly gravel. Mineralogy is mixed. Rock fragments on the surface range from 15 to 75 percent gravel, 0 to 30 percent cobbles, 0 to 30 percent stones, and 0 to 30 percent boulders.

The A horizon has dry color of 10YR 6/2, 6/3, 6/4, or 7/3 or 7.5YR 5/4, 6/3, or 6/4. Moist color is 7.5YR 3/3, 4/2, 4/3, 4/4, or 4/6 or 10YR 4/2 or 4/3. Texture is gravelly loam, very gravelly loam, gravelly sandy loam, very gravelly sandy loam, extremely gravelly sandy loam, or very gravelly fine sandy loam. The content of clay ranges from 12 to 26 percent. The horizon has 20 to 60 percent gravel, 0 to 20 percent cobbles, 0 to 20 percent stones, and 0 to 20 percent boulders. Reaction is slightly acid or neutral.

The Bt horizon has dry color of 7.5YR 5/4, 6/4, 6/6, or 7/4 or 10YR 7/2, 7/3, or 7/4. Moist color is 7.5YR 4/3, 4/4, 4/6, 5/4, or 5/6 or 10YR 4/2, 4/3, 4/4, or 5/4. Texture is very gravelly loam, extremely gravelly loam, very gravelly sandy loam, extremely gravelly sandy loam, extremely cobbly sandy loam, or very gravelly sandy clay loam. The content of clay ranges from 12 to 26 percent. The horizon has 25 to 70 percent gravel, 0 to 40 percent cobbles, 0 to 20 percent stones, and 0 to 20 percent boulders. Reaction ranges from moderately acid to neutral.

Whitecabin Series

The Whitecabin series consists of deep, poorly drained soils that formed in alluvium derived from mixed rock sources. These soils are in flood basins. Slopes are 0 to 1 percent. The mean annual precipitation is about 18 inches (457 mm), and the mean annual air temperature is about 60 degrees F (16 degrees C).

Taxonomic class: Fine, smectitic, thermic Aquic Haploxererts

Typical Pedon

Whitecabin silty clay, on a slope of 1 percent, under a cover of annual grasses, at an elevation of 101 feet (31 m). When described on 5/10/1995, the soil was slightly moist to a depth of 24 inches (61 cm) and moist from 24 to 53 inches (61 to 135 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 5 inches (0 to 13 cm); light brownish gray (10YR 6/2) silty clay, dark grayish brown (10YR 4/2) moist; 43 percent clay; moderate medium angular blocky structure parting to strong fine granular; extremely hard, firm, slightly sticky, very

plastic; common fine, few very fine, and few medium roots; few very fine tubular pores; common fine irregular brown (7.5YR 4/4) oxidized iron masses; noneffervescent; moderately acid, pH 5.9 by pH meter 1:1 water; abrupt smooth boundary.

Bss1—5 to 13 inches (13 to 33 cm); light brownish gray (10YR 6/2) silty clay, dark grayish brown (10YR 4/2) moist; 48 percent clay; moderate coarse prismatic structure parting to moderate fine angular blocky; extremely hard, firm, moderately sticky, very plastic; few very fine roots; common very fine tubular pores; few slickensides; noneffervescent; neutral, pH 7.0 by pH meter 1:1 water; gradual smooth boundary.

Bss2—13 to 26 inches (33 to 66 cm); brown (10YR 5/3) silty clay, dark grayish brown (10YR 4/2) moist; 49 percent clay; moderate coarse prismatic structure parting to moderate fine angular blocky; extremely hard, firm, moderately sticky, very plastic; few very fine roots; common very fine and few fine tubular pores; common slickensides; few fine and medium irregular worm nodules; noneffervescent; moderately alkaline pH 8.0 by pH meter 1:1 water; gradual smooth boundary.

Bss3—26 to 35 inches (66 to 89 cm); brown (10YR 5/3) silty clay, brown (10YR 4/3) moist; 50 percent clay; moderate medium prismatic structure parting to moderate fine angular blocky; extremely hard, firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; few slickensides; common fine dark gray (10YR 4/1) iron depletions and few fine spherical manganese masses; noneffervescent; strongly alkaline, pH 8.6 by pH meter 1:1 water; clear smooth boundary.

Bkss—35 to 45 inches (89 to 114 cm); yellowish brown (10YR 5/4) silty clay, dark yellowish brown (10YR 4/4) moist; 49 percent clay; moderate medium angular blocky structure; extremely hard, firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; few slickensides; common fine spherical black (N 2/0) manganese masses; common fine and medium carbonate threads; noneffervescent; strongly alkaline, pH 8.5 by pH meter 1:1 water; clear wavy boundary.

Bk—45 to 53 inches (114 to 135 cm); brown (7.5YR 5/4) silty clay, brown (7.5YR 4/4) moist; 46 percent clay; moderate fine subangular blocky structure parting to moderate fine granular; extremely hard, firm, moderately sticky, very plastic; few very fine roots; few very fine tubular pores; common fine and medium carbonate threads; common fine spherical black (N 2/0) manganese masses; noneffervescent; strongly alkaline, pH 8.5 by pH meter 1:1 water; abrupt wavy boundary.

2Bkqm1—53 to 63 inches (135 to 160 cm); indurated duripan; very pale brown (10YR 7/4) silt loam, yellowish brown (10YR 5/4) moist; 9 percent clay; massive; common very fine and fine tubular pores; few prominent continuous yellowish red (5YR 4/6) clay films in root channels and/or pores; common fine irregular black (N 2/0) manganese masses; common carbonate threads; noneffervescent; strongly alkaline, pH 9.0 by pH meter 1:1 water; silica- and lime-cemented, indurated capping 0.125 inch thick; roots matted on top of the capping; carbonate pendants on the underside of duripan plates; gradual smooth boundary.

2Bkqm2—63 to 72 inches (160 to 183 cm); moderately cemented duripan; very pale brown (10YR 7/4) silt loam, yellowish brown (10YR 5/4) moist; 14 percent clay; massive; moderately cemented; common very fine tubular pores; few prominent continuous yellowish red (5YR 4/6) clay films in root channels and/or pores; common fine carbonate threads and common fine irregular carbonate threads; noneffervescent; strongly alkaline, pH 8.9 by pH meter 1:1 water; 2 percent rounded gravel.

Type location: Butte County, California; about 1.7 miles southeast of Rancho Llano Seco headquarters, approximately 8,500 feet west of the Mt. Diablo meridian and

14,500 feet south of the boundary between T. 20 N. and 21 N.; in an unsectionized area in the Llano Seco Land Grant; 39 degrees, 34 minutes, 57 seconds north latitude and 121 degrees, 56 minutes, 48 seconds west longitude; NAD27; USGS Quad: Llano Seco, California.

Range in Characteristics

Depth to the duripan generally ranges from 40 to 60 inches (102 to 152 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry from about June to October 15 (120 to 125 days). The particle-size control section averages 45 to 55 percent clay. Mineralogy is dominantly smectitic. The depth to carbonates ranges from 6 to 39 inches (15 to 99 cm). The content of organic matter is 1 to 2 percent from a depth of 0 to 5 inches (0 to 13 cm) and 0.1 to 0.9 percent from 5 to 72 inches (13 to 183 cm). By ammonium acetate, base saturation ranges from 96 to 100 percent throughout the profile. Reversible, surface-initiated cracks 0.5 inch to 3 inches (1.27 to 8 cm) or more wide extend to a depth of 25 to 39 inches (64 to 99 cm) or more. They are open from May 15 to October 15 (about 150 days) when the soils are not irrigated and are closed the rest of the year. Slickensides occur in the Bss and Bkss horizons, at a depth of 5 to 45 inches (13 to 114 cm). A fluctuating water table can occur from the top of the duripan to 26 inches (66 cm) below the surface of the soil from December through April.

Some pedons have overwash of silt loam that ranges from 4 to 15 inches (10 to 38 cm) in thickness and has 18 to 27 percent clay or overwash of silty clay loam that ranges from 4 to 20 inches (10 to 51 cm) in thickness and has 27 to 40 percent clay. Depth to the duripan ranges from 40 to 81 inches (102 to 206 cm), depending on the thickness of the overwash.

The A horizon has dry color of 10YR 4/1, 4/2, 5/2, or 6/3. Moist color is 10YR 3/1, 3/2, 3/3, or 4/2. Texture is silty clay or clay. The content of clay ranges from 40 to 55 percent. The content of exchangeable sodium is 0 to 1 percent. SAR is 0 to 1. Redoximorphic features, such as oxidized iron masses with color of 7.5YR 4/4 or 4/6 and manganese masses with color of N 2/0, may occur in this horizon. Reaction ranges from moderately acid to neutral.

The Bss horizon has dry color of 10YR 5/2, 5/3, 5/4, 6/2, or 6/4. Moist color is 10YR 3/2, 3/3, 3/4, 4/2, 4/3, or 4/4 or 7.5YR 5/4. Texture is clay or silty clay. The content of clay ranges from 45 to 55 percent. The content of exchangeable sodium is 3 to 10 percent. SAR is 1 to 6. Redoximorphic features, such as manganese masses with color of N 2/0 and iron depletions with color of 10YR 4/1, occur in this horizon. Reaction ranges from slightly acid to strongly alkaline.

The Bkss horizon has dry color of 10YR 5/4, 6/3, or 7/4 or 7.5YR 5/4. Moist color is 10YR 3/3, 4/3, or 4/4 or 7.5YR 4/4 or 4/6. Texture is clay, silty clay, or clay loam. The content of clay ranges from 35 to 55 percent. The content of exchangeable sodium is 10 to 12 percent. SAR is 1 to 9. The horizon is noneffervescent to strongly effervescent. Calcium carbonate occurs as soft masses or concretions. The content of calcium carbonate is 0 to 1 percent. Redoximorphic features, such as manganese masses with color of N 2/0, occur in this horizon. Reaction ranges from slightly alkaline to strongly alkaline.

The Bk or 2Bk horizon has dry color of 10YR 6/4 or 7.5YR 5/4. Moist color is 10YR 4/4 or 7.5YR 4/4. Texture is clay, silty clay, or clay loam. The content of clay ranges from 35 to 55 percent. The content of exchangeable sodium is 10 to 12 percent. SAR is 1 to 8. The horizon is noneffervescent to strongly effervescent. Calcium carbonate occurs as soft masses or concretions. The content of calcium carbonate is 0 to 1 percent. The horizon has redoximorphic features, such as manganese masses with color of N 2/0. Reaction is moderately alkaline or strongly alkaline.

Wickscorner Series

The Wickscorner series consists of very deep, moderately well drained soils that formed in alluvium derived from basalt. These soils are on alluvial fans on Table Mountain. Slopes range from 2 to 10 percent. The mean annual precipitation is about 28 inches (711 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-loamy, mixed, superactive, thermic Ultic Palexeralfs

Typical Pedon

Wickscorner loam, on a west-facing slope of 5 percent, under a cover of annual grasses, at an elevation of 418 feet (127 m). When described on 4/17/2001, the soil was dry from 0 to 8 inches (0 to 20 cm) and slightly moist from 8 to 84 inches (20 to 213 cm). (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); brown (7.5YR 4/3) loam, dark brown (7.5YR 3/3) moist; 20 percent clay; weak fine and medium subangular blocky structure parting to moderate fine granular; hard, firm, slightly sticky, slightly plastic; many very fine and fine and common medium roots; many very fine irregular pores; 10 percent rounded basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 8 inches (5 to 20 cm); brown (7.5YR 4/3) loam, dark reddish brown (5YR 3/3) moist; 26 percent clay; moderate medium and coarse subangular blocky structure parting to moderate medium platy; very hard, very firm, slightly sticky, slightly plastic; many very fine and fine roots; few fine and medium tubular pores; 30 percent discontinuous distinct clay films on surfaces along pores; 2 percent rounded quartz gravel and 10 percent rounded basalt gravel; moderately acid, pH 5.8 by Hellige-Truog; gradual smooth boundary.

Bt2—8 to 22 inches (20 to 56 cm); brown (7.5YR 4/3) gravelly clay loam, dark reddish brown (5YR 3/3) moist; 30 percent clay; moderate medium and coarse subangular blocky structure; hard, firm, moderately sticky, moderately plastic; common very fine and fine roots; common fine and medium tubular pores; 40 percent discontinuous distinct clay films on faces of peds; 32 percent rounded basalt gravel; moderately acid, pH 6.0 by Hellige-Truog; clear wavy boundary.

2Bt3—22 to 38 inches (56 to 97 cm); brown (7.5YR 4/3) very gravelly clay loam, dark reddish brown (5YR 3/3) moist; 36 percent clay; moderate fine and medium subangular blocky structure; hard, firm, very sticky, very plastic; common very fine and fine roots; common very fine and fine and few medium tubular pores; 50 percent continuous distinct clay films on faces of peds; 3 percent rounded quartz gravel and 35 percent rounded basalt gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt wavy boundary.

2Bt4—38 to 59 inches (97 to 150 cm); brown (7.5YR 5/4) very gravelly clay, dark reddish brown (5YR 3/3) moist; 42 percent clay; moderate coarse subangular blocky structure; hard, firm, very sticky, very plastic; few very fine and fine roots; few fine and medium tubular pores; 50 percent continuous distinct clay films on faces of peds; 5 percent rounded quartz gravel and 45 percent rounded basalt gravel; slightly acid, pH 6.3 by Hellige-Truog; abrupt wavy boundary.

3Bt5—59 to 72 inches (150 to 183 cm); brown (10YR 4/3) extremely gravelly sandy clay, dark brown (10YR 3/3) moist; 48 percent clay; moderate fine and medium subangular blocky structure; noncemented; very hard, firm, very sticky, very plastic; few very fine roots on top of the horizon; few fine tubular pores; 30 percent discontinuous distinct clay films on faces of peds; 30 percent fine and medium iron depletions and 20 percent very fine manganese masses; 3 percent rounded

quartz gravel and 60 percent rounded basalt gravel with soft, weathered rinds; slightly acid, pH 6.3 by Hellige-Truog; clear wavy boundary.

3Bt6—72 to 84 inches (183 to 213 cm); yellowish brown (10YR 5/4) extremely gravelly sandy clay, brown (10YR 4/3) moist; 40 percent clay; moderate fine and medium subangular blocky structure; noncemented; very hard, firm, very sticky, very plastic; few fine tubular pores; 35 percent discontinuous clay films on faces of peds; 10 percent very fine manganese masses and 30 percent fine and medium iron depletions; 3 percent rounded quartz gravel and 60 percent rounded basalt gravel with soft, weathered rinds; slightly acid, pH 6.3 by Hellige-Truog.

Type location: Butte County, California; about 7.4 miles northwest of Oroville, approximately 2,800 feet west and 1,100 feet north of the southeast corner of sec. 2, T. 20 N., R. 3 E.; 39 degrees, 36 minutes, 54 seconds north latitude and 121 degrees, 36 minutes, 25 seconds west longitude; NAD83; USGS Quad: Oroville, California.

Range in Characteristics

Depth to the duripan is 60 to 80 inches (152 to 203 cm) or more. The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The soil moisture control section is dry in all parts from June through October 15 (about 135 days). The particle-size control section averages 27 to 35 percent clay and 20 to 35 percent rock fragments, mostly gravel. Below the control section, the content of clay is 35 to 55 percent and the content of rock fragments is 35 to 80 percent. Mineralogy is mixed. By sum of cations, base saturation ranges from 50 to 75 percent to a depth of 72 inches (183 cm). A fluctuating water table can occur at a depth of 50 to 84 inches (127 to 213 cm) or more from December through April. Redoximorphic features, such as manganese masses with color of N 2/0, occur in the 2Bt and 3Bt horizons. Rock fragments on the surface range from 0 to 5 percent gravel and 0 to 5 percent cobbles.

The A horizon has dry color of 7.5YR 4/3 or 5/3 or 10YR 4/3. Moist color is 7.5YR 2/2, 3/2, 3/3, or 4/3 or 10YR 3/3. Texture is loam or fine sandy loam. The content of clay ranges from 15 to 20 percent. The horizon has 0 to 10 percent gravel, mostly basalt and chert in small amounts. The content of organic matter is 2 to 6 percent. Reaction is moderately acid or slightly acid.

The Bt horizon has dry color of 7.5YR 4/3, 5/3, or 5/4 or 10YR 5/3. Moist color is 5YR 3/3, 3/4, or 4/3; 7.5YR 3/3, 3/4, or 4/3; or 10YR 3/4. Texture is loam, clay loam, gravelly loam, gravelly clay loam, gravelly sandy clay loam, or very gravelly loam. The content of clay ranges from 20 to 33 percent. The horizon has 5 to 35 percent gravel and 0 to 5 percent cobbles. The content of organic matter is 0.5 to 2 percent. Reaction ranges from very strongly acid to moderately acid.

The 2Bt horizon has dry color of 7.5YR 5/3 or 5/4, 5YR 4/4 or 5/4, or 10YR 5/3. Moist color is 5YR 3/3, 3/4, 4/3, or 4/4 or 7.5YR 3/3, 3/4, or 4/3. Texture is very gravelly clay loam, very gravelly clay, very gravelly sandy clay, gravelly clay, extremely gravelly clay loam, or very gravelly sandy clay loam. The content of clay ranges from 28 to 45 percent. The horizon has 2 to 60 percent gravel and 0 to 10 percent cobbles. The content of organic matter is 0.5 to 1 percent. Reaction ranges from strongly acid to neutral.

The 3Bt horizon has dry color of 10YR 4/3 or 5/4, 7.5YR 5/3 or 5/4, or 5YR 4/3, 4/4, 5/4, or 5/6. Moist color is 10YR 3/3, 3/4, or 4/3; 7.5YR 3/4, 4/4, or 4/3; or 5YR 3/3, 3/4, 4/3, or 4/4. Texture is extremely gravelly sandy clay, extremely gravelly clay, extremely gravelly clay loam, very gravelly sandy clay, or very gravelly clay. The content of clay ranges from 35 to 55 percent. The horizon has 35 to 65 percent gravel, 0 to 45 percent cobbles, and 0 to 2 percent stones. The content of organic matter is 0.2 to 0.8 percent. Reaction ranges from strongly acid to neutral. The horizon is noncemented or extremely weakly cemented.

Wilsoncreek Series

The Wilsoncreek series consists of very deep, moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on bars on flood plains. Slopes range from 0 to 2 percent. The mean annual precipitation is about 22 inches (559 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Fine-silty, mixed, superactive, thermic Cumulic Haploxerolls

Typical Pedon

Wilsoncreek loam, on a west-facing slope of less than 1 percent, under a cover of annual grasses and valley oak, at an elevation of 85 feet (26 m). When described on 5/16/1992, the soil was dry to a depth of 7 inches (18 cm) and moist from 7 to 60 inches (18 to 152 cm). (Colors are for dry soil unless otherwise noted.)

Ap—0 to 7 inches (0 to 18 cm); yellowish brown (10YR 5/4) loam, very dark grayish brown (10YR 3/2) moist; 22 percent clay; strong fine subangular blocky structure parting to strong fine granular; loose, very friable, slightly sticky, slightly plastic; few fine and many very fine roots; common fine irregular pores; 5 percent fine distinct and prominent dark brown (7.5YR 3/4 moist) and strong brown (7.5YR 4/6 moist) oxidized iron masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

A1—7 to 14 inches (18 to 36 cm); yellowish brown (10YR 5/4) loam, dark brown (10YR 3/3) moist; 13 percent clay; moderate fine and medium prismatic structure parting to medium and coarse subangular blocky; slightly hard, very friable, slightly sticky, slightly plastic; few fine and common very fine roots; few very fine tubular pores; 5 percent fine prominent strong brown (7.5YR 5/6 moist) and reddish brown (5YR 4/4 moist) oxidized iron masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

A2—14 to 25 inches (36 to 64 cm); yellowish brown (10YR 5/4) loam, dark brown (10YR 3/3) moist; 17 percent clay; moderate fine and medium prismatic structure parting to medium and coarse subangular blocky; slightly hard, very friable, slightly sticky, slightly plastic; few fine and common very fine roots; few very fine tubular pores; 1 percent fine faint strong brown and 5 percent fine distinct strong brown (7.5YR 5/6 moist) and brown (7.5YR 4/4 moist) oxidized iron masses; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

A3—25 to 34 inches (64 to 86 cm); dark yellowish brown (10YR 4/4) loam, dark brown (7.5YR 3/3) and brown (7.5YR 4/3) moist; 20 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine and fine roots; few very fine tubular pores; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bw1—34 to 44 inches (86 to 112 cm); brown (7.5YR 4/4) loam, brown (7.5YR 4/3) and dark brown (7.5YR 3/3) moist; 20 percent clay; moderate medium and coarse prismatic structure parting to fine and medium subangular blocky; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bw2—44 to 60 inches (112 to 152 cm); brown (7.5YR 4/4) loam, dark brown (7.5YR 3/3) moist; 18 percent clay; moderate fine and medium subangular blocky structure; slightly hard, very friable, slightly sticky, slightly plastic; few very fine roots; few very fine tubular pores; 1 percent fine faint and distinct yellowish brown (10YR 5/4 moist) and dark yellowish brown (10YR 3/4 moist) oxidized iron masses; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 2.0 miles southwest of Honcut, approximately 2,800 feet south and 300 feet west of the northeast corner of sec. 19,

T. 17 N., R. 4 E.; 39 degrees, 18 minutes, 49 seconds north latitude and 121 degrees, 33 minutes, 28 seconds west longitude; NAD27; USGS Quad: Honcut, California.

Range in Characteristics

The thickness of the solum is more than 60 inches (152 cm). The mean annual soil temperature is 61 to 65 degrees F (16 to 18 degrees C). The soil moisture control section is dry in all parts from about May 15 to October 31 (about 165 days) The particle-size control section averages 18 to 27 percent clay. Mineralogy is mixed. A fluctuating water table can occur at a depth of 36 to 60 inches (91 to 152 cm) or more from December through April. Some pedons have a C horizon.

The Ap horizon has dry color of 10YR 4/2, 4/3, 5/3, or 5/4 or 7.5YR 3/3. Moist color is 10YR 3/2 or 3/3 or 7.5YR 3/3. Texture is loam or silt loam. The content of clay ranges from 13 to 18 percent. The content of organic matter is 2 to 3 percent. By sum of cations, base saturation ranges from 75 to 85 percent. Redoximorphic features, such as oxidized iron masses with moist color of 10YR 4/6 or 5/6 or 7.5YR 3/4, 4/4, or 4/6, occur in this horizon. Reaction is slightly acid or neutral.

The A horizon has dry color of 10YR 4/3, 4/4, 5/3, or 5/4. Moist color is 10YR 3/2 or 3/3. Texture is loam or silt loam. The content of clay ranges from 13 to 27 percent. The content of organic matter is 1 to 3 percent. By sum of cations, base saturation ranges from 80 to 90 percent. Redoximorphic features, such as oxidized iron masses with moist color of 10YR 4/2, 5/2, or 5/3 or 7.5YR 3/2, 4/3, or 4/4, occur in this horizon. Reaction ranges from slightly acid to slightly alkaline.

The Bw horizon has dry color of 10YR 4/3 or 4/4 or 7.5YR 4/4. Moist color is 10YR 4/3 or 4/4 or 7.5YR 3/3 or 3/4. Texture is loam or silt loam. The content of clay ranges from 15 to 27 percent. The content of organic matter is 0.5 to 1 percent. By sum of cations, base saturation ranges from 85 to 95 percent. Redoximorphic features, such as oxidized iron masses with moist color of 10YR 4/6 or 5/6 or 7.5YR 3/4, 4/4, or 4/6, occur in this horizon. Reaction is neutral or slightly alkaline.

Woodleaf Series

The Woodleaf series consists of moderately deep, well drained soils that formed in material weathered from ultramafic rocks with a large amount of serpentine minerals. These soils are on ridgetops and side slopes on ultramafic Sierra Nevada mountains. Slopes range from 3 to 30 percent. The mean annual precipitation is about 65 inches (1,651 mm), and the mean annual air temperature is about 54 degrees F (12 degrees C).

Taxonomic class: Clayey-skeletal, magnesic, mesic Ultic Haploxeralfs

Typical Pedon

Woodleaf gravelly loam, at an elevation of 3,200 feet (975 m). (Colors are for dry soil unless otherwise noted.)

Oi—0.5 inch to 0 (1 cm 0); partially decomposed twigs and needles.

A1—0 to 4 inches (0 to 10 cm); dark yellowish brown (10YR 4/4) gravelly loam, dark yellowish brown (10YR 3/4) moist; moderate fine granular structure; slightly hard, very friable, slightly sticky, slightly plastic; common very fine to medium roots; many very fine and fine irregular and common very fine tubular pores; 20 percent gravel, 5 percent cobbles, and 1 percent stones; moderately acid; clear smooth boundary.

A2—4 to 9 inches (10 to 23 cm); strong brown (7.5YR 4/6) gravelly loam, dark reddish brown (5YR 3/4) moist; moderate fine granular structure; slightly hard, very friable, sticky, slightly plastic; common very fine to coarse roots; many very fine and fine irregular and common very fine and fine tubular pores; 25 percent

gravel, 5 percent cobbles, and 1 percent stones; moderately acid; clear wavy boundary.

2Bt1—9 to 17 inches (23 to 43 cm); yellowish red (5YR 4/6) very gravelly clay loam, dark reddish brown (5YR 3/3) moist; weak medium subangular blocky structure; hard, friable, sticky, plastic; many fine and medium and common very fine and coarse roots; many very fine to medium tubular pores; common thin clay films on faces of peds and in pores; 30 percent gravel, 15 percent cobbles, and 2 percent stones; moderately acid; clear wavy boundary.

2Bt2—17 to 28 inches (43 to 71 cm); brown (7.5YR 4/4) very gravelly clay, dark brown (7.5YR 3/4) moist; strong medium subangular blocky structure; very hard, firm, sticky, plastic; common medium and coarse roots; few very fine and fine tubular pores; many thick clay films on faces of peds; 30 percent gravel, 15 percent cobbles, and 2 percent stones; slightly acid; abrupt wavy boundary.

R—28 inches (71 cm); serpentine bedrock.

Type location: Yuba County, California; about 1 mile south of Woodleaf, approximately 3,000 feet south and 1,300 feet west of the northeast corner of sec. 16, T. 19 N., R. 7 E.; 39 degrees, 30 minutes, 15 seconds north latitude and 121 degrees, 11 minutes, 18 seconds west longitude; NAD27; USGS Quad: Clipper Mills, California.

Range in Characteristics

The depth to lithic bedrock is 20 to 40 inches (51 to 102 cm). The mean annual soil temperature is 47 to 54 degrees F (8 to 12 degrees C). The soil moisture control section is dry in all parts from about July 15 to September 15 (about 65 days). Mineralogy is magnesic. The content of organic matter is 2 to 3 percent to a depth of 9 inches (23 cm). Base saturation is 50 to 75 percent.

The A horizon has dry color of 10YR 5/4, 4/4, or 4/3 or 7.5YR 4/6. Moist color is 10YR 3/3 or 3/4, 7.5YR 3/4, or 5YR 3/4. Texture is gravelly loam. The content of clay ranges from 18 to 27 percent. The content of rock fragments ranges from 15 to 35 percent, including 10 to 30 percent gravel, 5 to 15 percent cobbles, and 0 to 3 percent stones. Reaction is moderately acid or slightly acid.

The 2Bt horizon has dry color of 10YR 6/4 or 6/6; 7.5YR 4/3, 4/4, or 4/6; or 5YR 4/6. Moist color is 10YR 4/4, 7.5YR 3/4, or 5YR 3/3 or 3/4. Texture is very gravelly clay loam or very gravelly clay. The content of clay ranges from 35 to 60 percent. The content of rock fragments ranges from 35 to 55 percent, including 25 to 40 percent gravel, 10 to 25 percent cobbles, and 0 to 3 percent stones. Reaction ranges from moderately acid to neutral. The ratio of calcium to magnesium is 1.5 or more. It generally increases with increasing depth.

Xerofluvents

Xerofluvents consist of very deep, somewhat poorly drained or moderately well drained soils that formed in alluvium derived from mixed rock sources. These soils are on bars and in channels on flood plains along tributaries of the Sacramento River. Slopes range from 0 to 4 percent. The mean annual precipitation is about 29 inches (737 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Typic Xerofluvents

Typical Pedon

Xerofluvents sandy loam, on a north-facing slope of 4 percent, under a cover of foothill pine, California sycamore, redbud, Pacific poison oak, ripgut brome, vetch, yellow starthistle, and mugwort, at an elevation of 300 feet (91 m). When described

on 4/13/1999, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 6 inches (0 to 15 cm); brown (10YR 5/3) sandy loam, brown (10YR 4/3) moist; 6 percent clay; single grain; loose, nonsticky, nonplastic; many very fine and fine and common medium roots; many very fine and fine interstitial and tubular pores; slightly acid, pH 6.5 by Hellige-Truog; gradual smooth boundary.

C1—6 to 14 inches (15 to 36 cm); brown (10YR 5/3) sandy loam, brown (10YR 4/3) moist; 4 percent clay; single grain; loose, nonsticky, nonplastic; many very fine to medium roots; many very fine interstitial pores; neutral, pH 7.2 by Hellige-Truog; gradual smooth boundary.

C2—14 to 26 inches (36 to 66 cm); pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; 2 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium roots; many very fine interstitial pores; neutral, pH 7.2 by Hellige-Truog; gradual smooth boundary.

C3—26 to 37 inches (66 to 94 cm); pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; 5 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium and few coarse roots; many very fine interstitial pores; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

Ab—37 to 43 inches (94 to 109 cm); brown (10YR 5/3) sandy loam, very dark grayish brown (10YR 3/2) moist; 10 percent clay; weak medium subangular blocky structure; loose, nonsticky, nonplastic; common very fine to coarse roots; many very fine interstitial pores; slightly alkaline, pH 7.5 by Hellige-Truog; clear smooth boundary.

C4—43 to 47 inches (109 to 119 cm); pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; 1 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium roots; many very fine interstitial pores; moderately alkaline, pH 8.0 by Hellige-Truog; clear smooth boundary.

C5—47 to 54 inches (119 to 137 cm); pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; 3 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium roots; many very fine interstitial pores; moderately alkaline, pH 8.0 by Hellige-Truog; gradual smooth boundary.

C6—54 to 72 inches (137 to 183 cm); pale brown (10YR 6/3) loamy sand, brown (10YR 4/3) moist; 2 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium roots; many very fine interstitial pores; moderately alkaline, pH 8.0 by Hellige-Truog; gradual smooth boundary.

C7—72 to 80 inches (183 to 203 cm); pale brown (10YR 6/3) sandy loam, brown (10YR 4/3) moist; 4 percent clay; single grain; loose, nonsticky, nonplastic; common very fine to medium roots; many very fine interstitial pores; moderately alkaline, pH 8.0 by Hellige-Truog.

Type location: Butte County, California; about 1.1 miles east of Horseshoe Lake, approximately 900 feet north and 2,450 feet east of the northwest corner of sec. 16, T. 22 N., R. 2 E.; in an unsectionized area in the Arroyo Chico Land Grant; 39 degrees, 46 minutes, 21 seconds north latitude and 121 degrees, 45 minutes, 35 seconds west longitude; NAD83; USGS Quad: Richardson Springs, California.

Range in Characteristics

The depth to bedrock is more than 60 inches (152 cm). The mean annual soil temperature is 48 to 64 degrees F (9 to 18 degrees C). The soil moisture control section is dry in all parts from about May to October (about 180 days). The particle-size control section averages 2 to 8 percent clay and 0 to 65 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur at a depth of 28 to 80 inches (71 to 203 cm) throughout the year. Redoximorphic features, such as oxidized iron masses with color of 7.5YR 5/6, occur in the C

horizon. Rock fragments on the surface range from 0 to 75 percent gravel, 0 to 40 percent cobbles, and 0 to 5 percent stones.

The A horizon has dry color of 7.5YR 6/2 or 6/3 or 10YR 5/3. Moist color is 7.5YR 4/2 or 4/3 or 10YR 4/3. Texture is sandy loam, gravelly sandy loam, very gravelly sandy loam, extremely gravelly sandy loam, cobbly sandy loam, or very cobbly sandy loam. The content of clay ranges from 2 to 10 percent. The horizon has 0 to 70 percent gravel and 0 to 40 percent cobbles. Reaction is slightly acid or neutral.

The C horizon has dry color of 10YR 5/3 or 6/3 or 7.5YR 5/3, 6/2, or 6/3. Moist color is 10YR 4/2 or 4/3 or 7.5YR 4/2 or 4/3. Texture is sandy loam, loamy sand, sand, coarse sand, or the gravelly, very gravelly, extremely gravelly, or cobbly analogs of those textures. The content of clay ranges from 1 to 8 percent. The horizon has 0 to 80 percent gravel and 0 to 35 percent cobbles. Reaction ranges from neutral to moderately alkaline.

The Ab horizon has dry color of 10YR 5/3 or 6/3. Moist color is 10YR 4/2 or 3/2. Texture is fine sandy loam or sandy loam. The content of clay ranges from 4 to 12 percent. The horizon has 0 to 15 percent gravel and 0 to 15 percent cobbles. Reaction is neutral or slightly alkaline.

Xerorthents, Shallow

Xerorthents, shallow, consist of very shallow or shallow, moderately well drained soils that formed in colluvium, residuum, and alluvium derived from volcanic rocks. These soils are on side slopes in canyons on Cascade foothills. Slopes range from 15 to 50 percent. The mean annual precipitation is about 28 inches (711 cm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Thermic Xerorthents

Typical Pedon

Xerorthents, shallow, gravelly clay loam, on a south-southwest-facing slope of 28 percent, under a cover of yellow starthistle and wild oat, at an elevation of 460 feet (140 m). When described on 11/09/1998, the soil was moist throughout. (Colors are for dry soil unless otherwise noted.)

A—0 to 2 inches (0 to 5 cm); grayish brown (10YR 5/2) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 31 percent clay; moderate medium subangular blocky structure parting to moderate fine granular; hard, friable, moderately sticky, moderately plastic; common fine and many very fine roots; many very fine to medium irregular and tubular pores; 20 percent gravel; neutral, pH 7.0 by Hellige-Truog; clear smooth boundary.

Bt1—2 to 5 inches (5 to 13 cm); grayish brown (10YR 5/2) gravelly clay loam, dark grayish brown (10YR 4/2) moist; 34 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine and fine tubular pores; 40 percent discontinuous faint clay films; 20 percent gravel and 25 percent cobbles; neutral, pH 7.2 by Hellige-Truog; gradual smooth boundary.

Bt2—5 to 8 inches (13 to 20 cm); grayish brown (10YR 5/2) very cobbly clay loam, dark grayish brown (10YR 4/2) moist; 37 percent clay; moderate medium subangular blocky structure; hard, friable, moderately sticky, moderately plastic; common very fine roots; common very fine and fine tubular pores; 60 percent discontinuous faint clay films; 20 percent gravel and 25 percent cobbles; neutral, pH 7.2 by Hellige-Truog; abrupt smooth boundary.

2R—8 inches (20 cm); white (10YR 8/1), strongly cemented volcanic sandstone, grayish brown (10YR 5/2) moist; slightly alkaline, pH 7.5 by Hellige-Truog.

Type location: Butte County, California; about 0.25 mile northeast of Horseshoe Lake, approximately 6,900 feet north and 2,200 feet west of the southeast corner of sec. 17, T. 22 N., R. 2 E.; in an unsectionized area in the Arroyo Chico Land Grant; 39 degrees, 46 minutes, 28 seconds north latitude and 121 degrees, 46 minutes, 35 seconds west longitude; NAD83; USGS Quad: Richardson Springs, California.

Range in Characteristics

The depth to lithic or paralithic bedrock is 2 to 20 inches (5 to 51 cm). The mean annual soil temperature is 59 to 67 degrees F (15 to 19 degrees C). The soil moisture control section is dry in all parts from about May to October (about 120 days). The particle-size control section averages 22 to 39 percent clay and 5 to 60 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. Rock fragments on the surface range from 0 to 25 percent gravel, 0 to 20 percent cobbles, 0 to 40 percent stones, and 0 to 40 percent boulders.

The A horizon has dry color of 10YR 5/2, 6/2, 6/3, or 7/2 or 7.5YR 5/4, 6/3, or 6/4. Moist color is 10YR 3/2 or 4/2 or 7.5YR 3/2, 4/2, or 4/3. Texture is loam, gravelly loam, clay loam, gravelly clay loam, very stony clay loam, gravelly sandy clay loam, or sandy loam. The content of clay ranges from 18 to 35 percent. The horizon has 3 to 25 percent gravel, 0 to 10 percent cobbles, and 0 to 20 percent stones. Reaction is neutral or slightly alkaline.

The Bt horizon has dry color of 10YR 4/3, 5/2, 5/3, 6/2, 6/3, or 7/2; 7.5YR 5/3, 6/2, 6/3, or 6/4; or 5YR 5/4. Moist color is 10YR 4/2 or 4/3; 7.5YR 4/2, 4/3, or 4/4; or 5YR 4/2 or 4/3. Texture is gravelly loam, very gravelly loam, clay loam, gravelly clay loam, very gravelly clay loam, very cobbly clay loam, sandy clay loam, gravelly sandy clay loam, very gravelly sandy clay loam, or very gravelly clay. The content of clay ranges from 23 to 42 percent. The horizon has 1 to 40 percent gravel, 0 to 25 percent cobbles, and 0 to 10 percent stones. Reaction ranges from slightly acid to slightly alkaline.

Xerorthents, Tailings

Xerorthents, tailings, consist of very deep, moderately well drained to somewhat excessively drained, anthropogenic (altered) soils that formed in human-transported material deposited by dredges as tailing piles after most of the fine-earth material was washed and removed during gold-dredging operations. These soils are on flood plains and stream terraces. Slopes range from 0 to 50 percent. The mean annual precipitation is about 23 inches (584 mm), and the mean annual air temperature is about 61 degrees F (16 degrees C).

Taxonomic class: Thermic Xerorthents

Reference Pedon

Xerorthents, tailings, very gravelly sandy loam, on a slope of 3 percent, under a cover of cottonwood, valley oak, blackberry, and annual grasses, at an elevation of 110 feet (33 m). When described 6/28/2001, the soil was dry to a depth of 35 inches (89 cm) and slightly moist below that depth. (Colors are for dry soil unless otherwise noted.)

A—0 to 3 inches (0 to 8 cm); brown (10YR 5/3) very gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; 16 percent clay; weak very fine and fine granular structure; soft, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine irregular pores; 10 percent well rounded cobbles and 45 percent well rounded gravel; strongly acid, pH 5.5 by Hellige-Truog; abrupt smooth boundary.

AC—3 to 8 inches (8 to 20 cm); brown (10YR 5/3) extremely gravelly sandy loam, dark yellowish brown (10YR 3/4) moist; 15 percent clay; moderate thick platy

structure; soft, very friable, slightly sticky, slightly plastic; many very fine roots; many very fine irregular pores; 5 percent well rounded cobbles and 60 percent well rounded gravel; slightly acid, pH 6.5 by Hellige-Truog; abrupt smooth boundary.

C1—8 to 21 inches (20 to 53 cm); brown (10YR 4/3) loamy sand, dark grayish brown (10YR 4/2) moist; 7 percent clay; moderate thick and medium platy structure; soft, very friable, nonsticky, nonplastic; many very fine roots; many very fine irregular pores; 10 percent well rounded gravel; neutral, pH 6.8 by Hellige-Truog; abrupt smooth boundary.

C2—21 to 26 inches (53 to 66 cm); brown (10YR 5/3) loamy sand, dark grayish brown (10YR 4/2) moist; 6 percent clay; moderate thick and medium platy structure; soft, very friable, nonsticky, nonplastic; many very fine roots; many very fine irregular pores; 5 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

C3—26 to 35 inches (66 to 89 cm); yellowish brown (10YR 5/4) loamy sand, brown (10YR 4/3) moist; 6 percent clay; moderate thick and medium platy structure; soft, very friable, nonsticky, nonplastic; few very fine roots; many very fine irregular pores; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

C4—35 to 48 inches (89 to 122 cm); brown (10YR 4/3) loamy coarse sand, dark grayish brown (10YR 4/2) moist; 5 percent clay; moderate thick and medium platy structure; soft, very friable, nonsticky, nonplastic; common very fine roots; many very fine irregular pores; neutral, pH 7.0 by Hellige-Truog; gradual smooth boundary.

C5—48 to 59 inches (122 to 150 cm); brown (10YR 4/3) loamy sand, dark grayish brown (10YR 4/2) moist; 6 percent clay; massive; soft, very friable, nonsticky, nonplastic; few very fine roots; many very fine irregular pores; 1 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog; abrupt smooth boundary.

C6—59 to 81 inches (150 to 206 cm); brown (10YR 4/3) loamy sand, dark grayish brown (10YR 4/2) moist; 6 percent clay; massive; soft, very friable, nonsticky, nonplastic; common very fine roots; many very fine irregular pores; 1 percent well rounded gravel; neutral, pH 7.0 by Hellige-Truog.

The reference pedon is an example of the soils within this category. It is not necessarily representative of the soils throughout the survey area. The texture, color, rock fragments, and thickness of layers vary considerably from one area to another.

Type location: Butte County, California; about 1.25 miles northwest of Oak Grove in the Oroville Wildlife Area, approximately 1,900 feet east and 1,500 feet south of the northwest corner of sec. 2, T. 18 N., R. 3 E.; 39 degrees, 26 minutes, 49 seconds north latitude and 121 degrees, 36 minutes, 26 seconds west longitude; NAD83; USGS Quad: Palermo, California.

Range in Characteristics

The depth of the soils is more than 80 inches (203 cm). The mean annual soil temperature is 62 to 64 degrees F (17 to 18 degrees C). The particle-size control section ranges from 3 to 7 percent clay, 70 to 90 percent sand, and 0 to 90 percent rock fragments, mostly gravel and cobbles. Mineralogy is mixed. A fluctuating water table can occur at a depth of 60 to more than 80 inches (152 to more than 203 cm) from December through July. Rock fragments on the surface range from 5 to 100 percent gravel, 10 to 100 percent cobbles, and 0 to 50 percent stones.

The A horizon has dry color of 10YR 4/2, 5/2, 5/3, or 6/3. Moist color is 10YR 3/2, 3/3, or 3/4. Texture is very gravelly sandy loam, very cobbly sandy loam, extremely cobbly sandy loam, or gravelly very fine sandy loam. The content of clay ranges from 10 to 16 percent. The horizon has 20 to 45 percent gravel and 10 to 60 percent cobbles. Reaction ranges from strongly acid to neutral.

The AC horizon has dry color of 10YR 5/3 or 6/3 or 7.5YR 5/3. Moist color is 10YR 3/4 or 7.5YR 3/4. Texture is extremely gravelly or extremely cobbly sandy loam. The content of clay ranges from 15 to 18 percent. The horizon has 30 to 60 percent gravel and 5 to 60 percent cobbles. Reaction is slightly acid or neutral.

The C horizon has dry color of 10YR 4/3, 5/3, 5/4, 6/3, or 6/4 or 7.5YR 4/3 or 5/3. Moist color is 10YR 4/2 or 4/3 or 7.5YR 3/4. Texture is loamy sand, loamy coarse sand, coarse sand, sand, cobbly loamy sand, very cobbly loamy sand, gravelly loamy sand, extremely gravelly loamy coarse sand, very gravelly loamy sand, or fine sandy loam. The content of clay ranges from 3 to 7 percent. The horizon has 0 to 90 percent gravel and 0 to 35 percent cobbles. Reaction is slightly acid or neutral.

Formation of the Soils

Soil is defined as a natural body comprised of solids (minerals and organic matter), liquid, and gases that occurs on the land surface, occupies space, and is characterized by one or both of the following: Horizons, or layers, that are distinguishable from the initial material as a result of additions, losses, transfers, and transformations of energy and matter and the ability to support rooted plants in a natural environment (Soil Survey Staff, 1999).

Soil also is defined as the unconsolidated mineral or organic material on the immediate surface of the earth that serves as a natural medium for the growth of land plants. This natural medium is subject to and shows the effects of the genetic and environmental factors of climate (including the effects of water and temperature) and of macro- and micro-organisms, as conditioned by relief. These factors act on the parent material over a period of time (Soil Science Society of America, 1997).

Soil genesis is defined as the mode of origin of the soil with special reference to the soil-forming processes or factors responsible for development of the solum, or true soil, from unconsolidated parent material (Soil Science Society of America, 1997).

Factors of Soil Formation

By Dean W. Burkett, Soil Survey Project Leader, Natural Resources Conservation Service.

The five major factors of soil formation are parent material, climate, time, topography, and living organisms. Soils vary across the landscape. The interaction among the five factors influences soil formation and determines the properties of an individual soil at any given place. Each factor influences and modifies the effects of the other four factors. The importance of individual factors differs from place to place, and the interactions are more complex for some soils than for others.

Parent material refers to the rock type, its mineralogical properties, and the mode of material deposition. Climate is essentially temperature and precipitation (amount and type). The influence of time on soil formation extends from the present to hundreds of thousands of years ago. Topography encompasses the steepness, aspect, and complexity of slopes, which play an important role in landscape stability and determine whether soils form in place or are transported by geologic erosion. Living organisms, both macro-organisms, such as animals, humans, birds, reptiles, earthworms, and insects, and micro-organisms, such as bacteria, fungi, nematodes, and protozoa, play an important role in soil formation. Their activities result in physical disturbance and the transformation of energy and matter.

Commonly, one factor dominates the soil-forming process. For example, material weathered from quartz diorite, which is uniform in composition, occurring over a large area will dominate the effects of climate, time, topography, and living organisms during the process of soil formation. No matter how variable the precipitation or slope gradient, the mineralogical properties of the parent material will determine soil properties.

In another example, climatic factors, such as high rainfall and warm temperatures, can dominate soil formation across a range of parent materials on complex slopes and

aspects with different plant communities. These factors form uniform soil properties despite the other soil-forming factors.

Parent Material

Parent material provides a physical foundation and is described according to the mode of deposition and the type and origin of rock or material that forms into soil. Parent material is grouped on the basis of the mode of deposition. The groups include residuum, which is material or bedrock that has weathered in place; alluvium, which has been transported and deposited by water; colluvium, which has been moved downslope by the force of gravity; eolian material, which has been transported and deposited by wind; and glacial drift, which has been transported by glaciers.

Parent materials may be grouped according to their point of origin. This survey area has three geomorphic provinces—the Great Valley, the Cascade Range, and the Sierra Nevada. These provinces are divided into 15 major geologic formations, which are subdivided into 32 geologic map units (Saucedo and Wagner, 1992). Rocks and sediments in the 32 geologic map units range in age from recent to approximately 415 million years old. Geologic map units help soil scientists to better understand relationships between the type and source of various parent materials.

In the Great Valley geomorphic province, the soils formed primarily in alluvium. This alluvium consists of both mixed rocks and sediments carried and deposited by creeks and rivers originating in the foothills and mountains of the Coast, Cascade, and Sierra Nevada Ranges.

In the Cascade Range, the soils formed in colluvium, eolian material, volcanic ash, and residuum weathered from rocks. The types of rocks include lava flows of extrusive igneous rocks, such as basalt and andesite; mixtures of volcanic ash and rocks that became cemented to form mudflow breccia; and tephra, a mixture of volcanic ash and rocks ejected during volcanic eruptions.

In the Sierra Nevada, the soils formed in colluvium, residuum, some alluvium, and some lava flows and tephra from volcanic materials. The rock types are quite variable, having originated from intrusive igneous rocks, such as quartz diorite, diorite, gabbro, or trondhjemite; both marine and nonmarine sedimentary rocks, such as sandstone, conglomerate, claystone, and glacial till; metamorphic rocks, including metasediments, metavolcanic rocks, metadiorite, green schist, and ultramafic rocks, such as serpentine; and extrusive igneous rocks, such as basalt, andesite, and pyroclastic mudflows.

At high elevations in both the Cascade and Sierra Nevada Ranges, the soils formed in glacial drift composed of quartz diorite, andesite, and basalt.

The pedogenic transformation of parent material into soil often begins as exposed rock is subject to various mechanical forces, such as heating and cooling, especially freezing and thawing, the growth of plant roots, precipitation, wind, and ice. These mechanical forces cause the disintegration of rocks, which are broken down into smaller and smaller sizes, eventually becoming sediment. With each decrease in particle size, surface area increases, allowing chemical transformations to break down the rocks concurrently with the mechanical forces.

The rate of physical and chemical breakdown varies by rock type because of differences in hardness, mineralogy, grain size, and porosity. Generally, soft bedrock, such as sandstone, weathers more quickly than hard bedrock, such as gabbro, under similar climatic conditions. Climatic factors also influence the rate of weathering. Generally, warm (not hot) temperatures along with high amounts of rainfall, which increase the activity of living organisms, weather rock and soil material much more quickly than cold temperatures and precipitation that falls mainly as snow.

The products of weathering may take many paths before becoming soil. They may be carried away by water and deposited many miles from their point of origin, or they may remain in place for thousands to millions of years.

Climate

Temperature and precipitation greatly influence weathering rates and the development of soil properties.

Temperature plays an important role in biologic activity and chemical transformations. Soil temperature influences organism growth and function, which drive the transformations and translocations of weathered products and overall development. During seasonal periods with either very warm or cold temperatures, soil-forming processes slow down. A soil temperature of 41 degrees F (5 degrees C) is considered biologic zero (the temperature of negligible growth and function for locally adapted plants). Growth and function cease at 32 degrees F (0 degrees C).

Soil temperature monitoring at a depth of 20 inches (50 centimeters) was completed during the survey to establish soil temperature regime boundaries. Three soil temperature regimes were observed within the survey area—thermic, mesic, and frigid. A thermic soil temperature regime has a mean annual soil temperature (MAST) between 59 and 71 degrees F (15 and 22 degrees C) and generally occurs at elevations between 55 and 2,000 feet (16 and 610 meters). A mesic soil temperature regime has a MAST between 47 and 59 degrees F (8 and 15 degrees C) and generally occurs at elevations between 2,000 and 4,800 feet (610 and 1,463 meters). Mesic conditions extend down to an elevation of 500 feet (152 meters) in canyons and on northeast-facing slopes. A frigid soil temperature regime has a MAST of less than 47 degrees F (8 degrees C) and generally occurs at elevations between 4,800 and 6,115 feet (1,463 and 1,864 meters). Frigid conditions extend down to an elevation of 3,320 feet (1,012 meters) in canyons and on northeast-facing slopes.

The quantity and form of precipitation influence soil formation physically through the translocation of clay and salts through the soil profile and biologically through organism function and the transformation of energy and matter. Rainfall infiltrates the soil surface and percolates downward through pores, cracks, and voids in the profile, commonly moving clay, nutrients (cations), and humic acids. In this survey area, the amount of precipitation generally ranges from 18 inches (457 millimeters) in the Sacramento Valley to more than 80 inches (2,032 millimeters) in the mountains (fig. 2). This variability occurs over a distance of only 50 miles (80 kilometers). It illustrates a strong “orographic effect” produced by the prevailing weather pattern across the survey area. With increasing elevation from west to east, the air becomes cooler as it rises up foothill and mountain slopes, resulting in increased precipitation.

Snowfall is common at an elevation of about 3,000 feet (914 meters) and occasionally occurs down to an elevation of about 1,000 feet (305 meters). At an elevation of about 4,000 feet (1,219 meters), snow becomes the dominant form of precipitation during the winter months.

Areas primarily receiving high amounts of rainfall tend to develop strongly expressed soil profiles with distinct horizons, if given enough time, compared to areas primarily receiving snow.

Two soil moisture regimes, xeric and aquic, occur in this survey area. The most prevalent one is the xeric moisture regime, which is characterized by cool, moist winters and warm, dry summers. In normal years, the soil moisture control section is dry for 45 or more consecutive days in the 4 months following the summer solstice and moist in all parts for 45 or more consecutive days following the winter solstice.

Soils with an aquic moisture regime are saturated by water for at least enough time to develop anaerobic or reducing conditions. As the soils become saturated, pore

space is displaced by water and dissolved oxygen is depleted. In the absence of oxygen, anaerobic micro-organisms first utilize manganese and then iron as an energy source and manganese and iron are reduced. Reduced manganese and iron are soluble and are carried downward through the soils by water. Water tables rise and move downward in response to the amount and timing of precipitation. When the water table moves downward, air reenters pores and manganese and iron become oxidized and precipitate in the form of concentrations. This seasonal flux is called oxidation-reduction. Redoximorphic features left in the soil are evidence of this process.

Time

Time is needed for the interaction of the other soil-forming factors to develop soils. The parent materials in this survey area range in age from recent to more than 400 million years old. Long periods of time are required for the development of soil horizons and the formation of soils from the parent material. Some soil horizons can form in a matter of several hundred years or less, but changing the parent material into a fully developed soil can take thousands or hundreds of thousands of years.

Estimating the age of a soil is difficult and is not absolute. Present-day soils provide clues to changing environmental conditions, such as climate change, volcanic activity, and geologic uplift. Even after a soil has formed, it is subject to the influence of the other factors of soil formation. For example, soils in valleys may have undergone cyclic periods of deposition, development, and erosion over long periods of time. Some landscapes are forming, others are degrading, and many are forming and degrading simultaneously.

The importance of time to the process of soil formation is related to periods of stability and instability. Soils on young landscapes, such as flood plains where deposition is active, have not had sufficient time to develop surface horizons with an accumulation of organic matter or to develop horizons that have been altered because of instability. Soils on fan terraces, foothills, and mountains have been stable for long enough periods for the formation of well expressed horizons of illuviated clay. Soils that formed on alluvial fans have developed surface horizons with an accumulation of organic matter because of the associated grass-dominated vegetation. Subsurface layers have been only minimally altered because of the young age of the sediments.

Topography

Topography, or the shape of the landscape, affects soil formation through its influence on climate, precipitation, temperature, and living organisms, specifically, the vegetative cover. Topography includes elevation, slope, aspect, and landscape position.

Elevation influences soil formation through its effect on precipitation and temperature. As elevation increases, air and soil temperatures decrease and the amount of precipitation increases. The elevation in this survey area ranges from 55 to 6,115 feet (17 to 1,864 meters). Landscape position and slope influence soil formation by affecting the movement and retention of water in the soil. The aspect of a slope influences soil formation by modifying soil climate.

Slope influences drainage, runoff, and erosion. The slope of valley landscapes is generally level or nearly level. Precipitation that falls on flood plains, in flood basins, and on alluvial fans is retained in the soils because there is relatively little runoff. Fan terraces, foothills, and mountain slopes range from gently sloping to very steep. Generally, the soils that formed on ridgetops have more strongly expressed horizons than the soils on steep canyon side slopes. Slope stability allows parent material to develop in place. With little runoff, more water is available to percolate through the soil, promoting soil formation. Active, steep slopes are unstable, and parent material on

these slopes may move downhill as colluvium or dry ravel. Runoff can be high, slowing the development processes because there is less water available. Complex slopes are both convex and concave. Generally, concave slopes are more stable than convex slopes and tend to have soils with more strongly expressed horizons because of a greater amount of available water and, in response, more luxuriant vegetative growth and increased development.

Aspect is the compass direction that a slope faces. Generally, south- and west-facing slopes are hotter and drier than north- and east-facing slopes. In some areas soils are more strongly developed on north- and east-facing slopes because cooler temperatures allow more effective moisture to aid in translocating clays through the profile. In the southeast part of the survey area, for example, the soils on south-facing mountain slopes at high elevations have developed an ochric epipedon and a cambic horizon, whereas the soils on north-facing slopes have developed an umbric epipedon and an argillic horizon. Vegetative communities adapt to differences in climatic conditions influenced by aspect. Because of differences in effective moisture and temperature, for example, ponderosa pine grows on north- and east-facing slopes at the lower elevations and on south- and west-facing slopes at the higher elevations.

Living Organisms

Living organisms play an important role in soil formation. They are responsible for physical disturbances, additions and incorporation of organic matter, nutrient cycling, chemical transformations, removal of water and nutrients, and changes in structure and porosity.

Animals, including humans, birds, and reptiles, influence soil formation by causing physical disturbances, such as digging or burrowing, creating pathways for water entry, and mixing horizons. As birds disperse seeds, they affect the distribution of plant communities. Also, they use insects and earthworms as food.

Soil organisms, such as arthropods, bacteria, earthworms, fungi, nematodes, and protozoa, are extremely important in driving the soil-forming process by incorporating and decomposing organic matter and transforming chemical compounds in the soil. They are primarily responsible for the carbon-nitrogen cycle and nutrient cycling.

Arthropods, such as ants, beetles, centipedes, millipedes, mites, scorpions, spiders, and springtails, are invertebrates that live in the soil. They shred plant materials as they eat bacteria and fungi, enhancing the decomposition of litter into organic matter in the soil. Also, they improve soil structure by burrowing and releasing enzymes, aggregating soil particles, controlling the number of soil organisms by predation, mineralizing nutrients and making them available to plants by consuming fungi, feeding on plant roots, and physically improving porosity and water infiltration as they burrow.

Bacteria play a role in the decomposition of carbon. They immobilize nutrients, such as nitrogen and carbon; impact the nitrogen and carbon cycles; fix nitrogen in a symbiotic relationship with plant roots; use compounds, such as nitrogen, sulfur, hydrogen, manganese, and iron; and influence porosity and soil structure.

Earthworms live throughout the soil and perform many functions. They decompose organic matter and incorporate it into the soil by shredding and burying plant residue. Earthworm channels provide conduits for roots and allow water to infiltrate the soil. The earthworms also mix soil and exude compounds that aggregate soil particles, forming structure.

Fungi decompose dead organic matter, release carbon dioxide and organic acids, immobilize nutrients, and cause or control plant diseases. Mycorrhizal fungi live in or on the roots of grasses, shrubs, and trees and have a symbiotic relationship with roots. By utilizing plant carbon, they improve the availability of nutrients, making them more soluble. They also effectively increase the surface area of the plant roots.

Nematodes are worm-shaped organisms that perform mostly beneficial functions in the soil. They mineralize nutrients, especially ammonium, after consuming fungi or bacteria and help to distribute bacteria and fungi throughout the soil by transporting them on their surfaces. Certain nematodes that attach to plant roots cause disease in agricultural crops and are considered pests.

Protozoa require soil water for movement. Their main function in the soil is to consume nutrient-rich bacteria, mineralizing excess nutrients and making them available for uptake by plant roots (USDA, 1999).

Vegetation significantly affects soil formation by providing a source of organic matter. It influences the cycling of nutrients and their release during decomposition, uses nutrients and water, and causes physical alteration as roots grow through the soil, forming channels, which provide a conduit for air and water. Plant communities have adapted to climate, aspect, elevation, and associated soils.

This survey area has many plant communities because of the diversity of soils, parent material, elevation, and associated climatic factors. A generalized vegetative transect beginning at the Sacramento River and ending in the high mountains includes the many plant communities. These are riparian forest on flood plains, emergent wetland (now rice crops) in basins, valley oak-savanna (now cropland) on alluvial fans, annual grassland on terraces, blue oak-savanna in the low foothills, shrub-hardwood in the high foothills, conifer-hardwood in the low mountains, mixed conifer at the next level of the mountains, and conifer communities dominated by white fir and red fir in the high mountains.

Human activities that manipulate vegetation include brush clearing, crop production, natural species restoration, and forest management. These activities influence organic matter additions and decomposition rates, soil temperature, and moisture levels. When water and/or fertilizer are added to the soil, the soil-forming process is accelerated.

Such human activities as digging, tilling, leveling, and filling disturb soil horizons through mixing and removal. The natural hydrology associated with soil formation has been altered by the construction of dams and levees for flood protection, by the construction of ditches and canals for water conveyance, and by irrigation or drainage systems for agricultural production. This alteration changes the amount of water that is available to enter the soil and the period when the water is available. For example, the application of irrigation water to produce an annual crop of rice is equal to approximately 2.5 years of present annual rainfall. In this survey area, rice has been irrigated since about 1915. The irrigation water added to the soil amounts to about 327 acre-feet of water, as compared to 136 acre-feet added naturally as rain. By far, the greatest human impact on soil formation occurs when roads and buildings are constructed. This construction can essentially stop the soil-forming process by sealing off the surface of the soil, thereby eliminating any further addition of water, organic matter, air, and nutrients.

Diagnostic Horizons and Characteristics

By Dean W. Burkett, Soil Survey Project Leader, Natural Resources Conservation Service.

The five soil-forming factors produce diagnostic horizons with a natural arrangement, which collectively form a soil profile. Horizon development is regulated by four processes—additions, removals, transformations, and translocations. The characteristics of a given soil are the result of unique combinations of diagnostic horizons or the lack of diagnostic horizons. Soils are classified, mapped, and interpreted on the basis of the development and arrangement of horizons. A formal soil classification system, or soil taxonomy, is based on the identification of diagnostic horizons described in the section “Classification of the Soils.” Complete descriptions of surface and subsurface diagnostic horizons are given in “Soil Taxonomy” (Soil Survey Staff, 1999). Abbreviated descriptions of the diagnostic horizons in this survey area

are given in the paragraphs that follow. Also, three diagnostic characteristics (densic material, lithic contact, and paralithic contact) are described.

An **ochric epipedon** is a light colored surface horizon or a dark but thin surface horizon with or without a relatively high content of organic matter. Base saturation (by ammonium acetate) may be less than or more than 50 percent. Generally, the ochric epipedon fails to meet the definition of the other seven epipedons described in "Soil Taxonomy" because it is too thin, has too high a color value or chroma, contains too little organic matter, or is hard or massive. Soils that are very young or lack development, soils that are fairly old and moderately weathered, soils that are unstable, and soils that are too moist or too cold to meet the definition of the other seven epipedons commonly have an ochric epipedon. Generally, organic matter does not accumulate because there is little vegetation to supply organic matter or the organic matter has been oxidized.

A **mollic epipedon** is a thick, dark surface horizon that contains a minimum of 0.6 percent organic carbon (1 percent organic matter) and has base saturation (by ammonium acetate) of 50 percent or more. Mollic epipedons form in areas where landforms are old and stable, precipitation is adequate for the production of fair to luxuriant plant growth in normal years, and air and soil temperatures are sufficient to aid organisms in the decomposition of significant amounts of organic matter and in the incorporation of organic matter into the soil.

An **umbric epipedon** is a dark surface horizon that has all of the characteristics of a mollic epipedon, except that its base saturation (by ammonium acetate) is less than 50 percent in some or all parts. Umbric epipedons form in areas with relatively high precipitation that removes or leaches base cations from the soil profile. They generally are in areas of coniferous forests.

An **argillic horizon** is a subsurface horizon with a significantly higher percentage of clay than the overlying soil material. Parent material must undergo long periods of landscape stability, significant amounts of precipitation, and relatively warm temperature for clay formation and movement of clay from an upper horizon to a lower horizon. Alternating seasonal periods of rainfall and the subsequent dry periods promote the formation of an argillic horizon. The part of the soil that has undergone a loss of clay is referred to as an eluvial horizon. The part that gains clay is referred to as an illuvial horizon. A few thousand years or more are needed for the formation of an argillic horizon.

A **calcic horizon** is an illuvial horizon with a significant accumulation of calcium carbonates. Calcium carbonates are fairly mobile and move up and down through the profile seasonally. During winter, they move downward in percolating soil water. During spring and summer, as the soil dries or water tables drop, carbonates move upward because of capillary rise, evaporation, and transpiration. Eventually, the calcium carbonates accumulate to form a calcic horizon.

A **cambic horizon** is a subsurface horizon resulting from physical alterations, chemical transformations or removals, or a combination of two or more of these processes. The physical alteration that accompanies shrinking and swelling causes cracks to open and close. The physical forces associated with expansion wedge up blocks of clay, resulting in the formation of slickensides. Iron in the soil is reduced during seasonal periods of saturation and is oxidized during dry periods, producing redoximorphic features, which are considered evidence of the chemical transformation of iron.

A **duripan** is a subsurface horizon that is cemented by illuvial silica to the degree that water movement and the penetration of most roots are restricted. Although the degree of cementation varies, almost all duripans are most strongly cemented at the upper interface. The degree of cementation decreases with increasing depth. A stable environment, moderate, seasonally distributed rainfall, and an available source of silica are required for the formation of a duripan. Duripans occur on old landscapes, generally

between 100,000 and 2.6 million years old. The available silica commonly is from volcanic activity. Soluble silica moves through the soil profile, begins to accumulate, and plugs pores at a depth that corresponds to the amount of available precipitation. Silica continues to accumulate, eventually forming a laminar cap that thickens over time.

Densic material consists of tightly packed, noncemented, relatively unaltered soil material that is water and root restricting, causing seasonal saturation.

Lithic contact is the boundary between soil material and an underlying coherent material, commonly hard or unweathered bedrock. Generally, roots cannot penetrate into lithic materials, but water may move downward through cracks or laterally across the top of the lithic contact. A lithic contact is sufficiently hard to make hand digging impractical.

Paralithic contact is the boundary between soil material and the underlying partially weathered, weakly consolidated paralithic material or soft bedrock. Roots generally cannot penetrate into paralithic materials, though they can grow into the cracks.

Developmental Sequences

By Dean W. Burkett, Soil Survey Project Leader, Natural Resources Conservation Service.

The relationships between landform, parent material, climate, soil properties, and the resulting vegetation at any given place correlate directly to the five factors of soil formation, which determine the arrangement of horizons that form a specific soil. Knowledge of these zonal relationships or developmental sequences (O'Geen, A.T.) helps soil scientists and others to understand the properties and interpretations of the soils in the survey area.

Two developmental sequences are described in the following paragraphs. Figure 28 shows the location of block diagrams (figures 29 and 30) of the two developmental sequences.

The first developmental sequence is a climosequence of soils in which the parent material is derived from Cascade volcanic material. Refer to figure 29 for help in understanding the soil and landscape relationships in this sequence. The second development sequence includes soils and landscapes formed from a variety of parent materials primarily associated with the Sierra Nevada foothills and mountains. Refer to figure 30 for help in understanding the soil and landscape relationships in this sequence. The general soil map of this survey area can help to provide an understanding of the overall picture of the relationships of soils, landscapes, and parent materials in the area.

Cascade Developmental Sequence

This sequence includes soils on flood plains, in flood basins, on alluvial fans, on fan terraces, and on foothills and mountains.

Thermic Soils on Flood Plains

Refer to the light blue area in figure 29 and to general soil map unit 1.

The soils on large river flood plains in the Sacramento Valley are the result of sediment deposition during periods of flooding. Since 1900, there have been 11 major floods on the Feather River and 15 major floods on the Sacramento River. There have been 10 major floods on the Sacramento River since Shasta Dam was completed in 1945.

Prior to the construction of dams and levees, the rivers were free to meander within the natural flood plains. The particle size of the sediment deposited is dependent on the specific reach of the river and on the velocity of the water as it flows. The

Figure 30.—Block diagram 2.

sequence of deposition is dependent on the velocity and volume of water flowing through the main channel and the amount of material in suspension (the suspended load). During flood stage, the river carries sediment and moves previously deposited sand, gravel, and cobbles. The river also gains additional suspended load from tributaries. For example, Stony Creek carries gravel that enters the Sacramento River in the reach between Big Chico Creek and the Butte-Glenn county line. As the velocity of the water slows, the coarsest material (e.g., gravel) drops out of suspension. If the velocity slows further, the next largest size material (sand) drops out. Next to drop out of suspension is silt, and the last to drop out is clay, the smallest sized particles. The reach of the river determines the size of the particles carried in suspension as the water speeds up and slows down when it flows downstream. During periods of flooding, the water has exceeded the capacity of the main channel and begins to flow out of the banks of the main channel and to deposit sediment (overbank deposits).

In a perpendicular direction away from the main channel, a typical sequence of soils and landforms is created by the power of the river to either erode or deposit sediment. Directly adjacent to the main channel and commonly within the main channel, cobbles, gravel, and sand are deposited, forming point bars. The sand, gravel, and cobbles shift annually and are moved by flowing water until the active channel moves or the point bar becomes stabilized. This new sediment is not considered soil because it is too young (recent) and has yet to undergo any of the soil-forming processes. Riverwash is a miscellaneous area typically occurring in and adjacent to the main channel composed of sand and gravel.

The meander-belt portion of the flood plain occurs away from the river channel. It consists of light colored, very deep, coarse textured soils with some stratification, poorly defined horizonation, and no diagnostic horizons or discernible morphological features. These soils include Typic Xerofluvents, which are represented by the coarse-loamy Gianella soils. These soils are throughout the meander belt and have varying textures in the surface layer because of flooding and in places have gravel lenses within the profile. Oxyaquic Xerofluvents are represented by the coarse-loamy Columbia soils, which have a fluctuating water table below a depth of 20 inches (51 centimeters) and are in old channels that have been partially filled with sediment during channel migration. Aeric Fluvaquents are typified by the coarse-loamy Columbia taxadjunct in oxbows, which are crescent-shaped channels that have been partially filled with sediment and often remain wet throughout the year and, in early stages, occur as lakes. Because the meander belt is flooded, only riparian species, such as willow, cottonwood, boxelder, blue elderberry, and coyote brush, can become established on this landform.

A flood plain consisting of very deep, silty soils occurs outside of the meander belt and at a slightly higher elevation. The soils on this flood plain include Fluvaquentic Haploxerepts, which are represented by the fine-silty Parrott soils. These soils are on bars and have an ochric epipedon and a cambic horizon. Representing Aquic Haploxerepts are the fine-silty Vermet soils, which have an ochric epipedon, a cambic horizon, aquic conditions, and redoximorphic features and are in channels that make up a bar-and-channel topography that appears rolling. Many areas have been leveled for agriculture. Because flooding is less frequent on this flood plain than in the lower areas and floodwater moves at a lower velocity, valley oak became established. In areas used for orchard crops, most of the soils on the flood plain have a slightly darkened surface layer because of the accumulation of leaves and herbaceous growth.

A transitional zone occurs between flood plains and distal alluvial fans. The soils in this zone include Fluventic Haploxerepts, which are represented by the very deep Farwell soils. The soil profile provides evidence that these soils formed in alluvium derived from flood-plain sediments deposited over distal alluvial fan sediment. The soils have an ochric epipedon and a cambic horizon and have 27 to 35 percent clay in the particle-size control section. They are rarely flooded or occasionally flooded.

Thermic Soils in Flood Basins

Refer to the dark blue area in figure 29 and to general soil map units 3 through 6.

Flood basins are in the lowest position on the landscape. The sediment that fills the basin is less than 10,000 years old (State of California, Department of Water Resources, 1978). Clay-sized particles in suspension are the last of the sediment load carried by floodwater to settle. Very slowly moving or stagnant water is required for clay to fall out of suspension. The clay deposits are dominantly smectitic clay, range in thickness from 20 to more 60 inches, and have an average depth of 38 to 42 inches. The clay is underlain by unrelated sediments, which are cemented by silica in the upper part.

The soils in the basins include Xeric Epiaquerts, which are represented by the deep Lofgren soils, and Xeric Duraquerts, which are represented by the moderately deep Blavo soils. The Lofgren and Blavo soils are both very-fine, have as much as 70 percent clay, and are in the trench or lowest portion of the flood basin. The natural landscape had meandering channels and was hummocky because of the physical forces of the clay exhibited during seasonal periods of shrinking and swelling. The natural emergent marsh vegetation provided enough organic matter to produce a mollic epipedon. Cracks that formed during dry periods, slickensides that formed by shrinking and swelling, and redoximorphic features produced during the reduction and oxidation of iron under saturated conditions provide evidence of alteration. The soils have a cambic horizon. They also have a duripan with a very thin indurated cap over weakly cemented to strongly cemented sediments. A fluctuating water table is perched on top of the duripan. Refer to general soil map unit 3.

Much of the remainder of the flood basins is occupied by Xeric Epiaquerts, which are represented by the very deep Edjobe soils and the deep Esquon soils, and Xeric Duraquerts, which are typified by the moderately deep Neerdobe soils. The Edjobe, Esquon, and Neerdobe soils have 40 to 60 percent clay. They exhibit the same properties as those of the Lofgren and Blavo soils, but they also have an ochric epipedon, which is attributed to the oxidation of organic matter during long periods of dry conditions in summer. Refer to general soil map unit 4.

Clayey buried soils that formed in outwash resulting from hydraulic mining for gold are within the flood basins. Large pulses of sand and silty sediment were released into creeks, filling channels and causing overbank flooding and deposition of sediment on the surface of the Esquon and Neerdobe soils. Oxyaquic Xerofluvents along Butte Creek are represented by the very deep Govstanford soils, which have 20 to 36 inches of coarse-loamy hydraulic mine sediment over basin clay. Very deep Oxyaquic Xerofluvents are along Dry Creek, which becomes the Cherokee Canal and ends at Sanborn Slough. These soils have 24 to more than 72 inches of coarse-loamy mine sediment deposited over clay in the upper reach, fine-loamy mine sediment in the middle reach, and fine textured mine sediment in the lower reach. The mine sediments, locally named “slickens,” were thick enough in areas near the town of Richvale for the production of vegetables. Refer to general soil map units 3 and 4.

Two interfan basins are between Rock Creek and an area south of Mud Creek. They are between alluvial fans and adjacent to fan terraces. The soils in these basins include Typic Haploxererts, which are represented by Bosquejo soils. These soils are very deep to volcanic sediments, have a fine particle-size class, have a mollic epipedon and a cambic horizon, form cracks when dry, have slickensides, and have a seasonally fluctuating water table. Also included are Aquic Durixererts, which are represented by Galt soils. These soils are moderately deep to a duripan, have 40 to 60 percent clay, have slickensides, are seasonally saturated, form cracks when dry, and are on remnant terraces of the Red Bluff Formation amongst the interfan basins. Refer to general soil map unit 5.

Aquic Durixererts, which are typified by the moderately deep Subaco taxadjunct, are in the southernmost part of the Butte Basin, adjacent to alluvial fans of the Sutter

Buttes. These soils are underlain by a thin duripan, which caps thick deposits of silt originating from ancestral Lake Mohawk and associated with the lower Modesto Formation (Busacca, 1982). The soils have a mollic epipedon, have surface-initiated polygonal cracks that open when the soils are dry, and have a calcic horizon resulting from an accumulation of calcium carbonate and some sodium. In the past, acidic cannery waste was applied to these soils in order to reduce high levels of calcium carbonate, the reaction (pH) of the soils, and the adverse effects of the soils on crop production. This management practice proved unsuccessful because of poor drainage and a fluctuating water table, which did not allow calcium carbonate to be eliminated from the soils. Because farming is not profitable, most areas of these soils are used as wildlife refuges. Refer to general soil map unit 6.

The soils on distal alluvial fans and in transitional areas from distal alluvial fans to basins include Pachic Haploxerolls, which are represented by Busacca soils. These soils have a thick mollic epipedon and a cambic horizon and average 35 to 40 percent clay in the particle-size control section.

Thermic Soils on Alluvial Fans

Refer to the purple area in figure 29 and to general soil map units 8 and 9.

The alluvial fans in this survey area generally are gently sloping areas between flood plains to the west or flood basins to the south and terraces or foothills to the east. The sediment deposited by Pine, Rock, Mud, Big Chico, and Little Chico Creeks is dominantly of Cascade volcanic origin, whereas the sediment deposited by Butte Creek is of Sierra Nevada and Cascade origin. The sediments that make up the Modesto Formation probably are about 9,000 to 70,000 years old (Busacca, 1982). The Modesto Formation is divided into a younger, upper member (9,000 to 29,000 years BP) and an older, lower member (probably 29,000 to 70,000 years BP). The natural vegetation included valley oak and perennial and annual grasses and forbs, which contributed large amounts of organic matter and formed a thick mollic epipedon. Presently, almond and walnut orchards are grown on these highly productive soils. Alluvial fans can be subdivided on the basis of relative position away from the point where creeks debouch from the stream terraces or foothills. Pachic Haploxerolls are the dominant soils on alluvial fans and are represented by Conejo, Almendra, and Vina soils.

Conejo soils occur on the distal portion of the alluvial fans, which is adjacent to flood basins and in some areas flood plains and is the part of the fans farthest away from fan terraces and foothills. These highly productive soils have a thick mollic epipedon, a cambic horizon, 27 to 35 percent clay in the particle-size control section, and calcium carbonate in the subsoil. Refer to general soil map unit 8.

Almendra soils are in mid-fan positions, which are higher than distal fans. These soils have a thick mollic epipedon and a cambic horizon and differ from Conejo soils in that they do not have calcium carbonate in the subsoil and have 18 to 27 percent clay in the particle-size control section. Ignord soils are on beach ridges, which formed when water in the flood basin was at a high level and wind-pushed waves could lap up on the alluvial fan. These soils have moderate levels of calcium carbonate, a thick mollic epipedon, and a cambic horizon. Refer to general soil map unit 8.

Vina soils have a thick mollic epipedon, a cambic horizon, and 18 to 27 percent clay in the particle-size control section and formed throughout the alluvial fans, along channels. Refer to general soil map unit 8.

Representing Typic Haploxerolls are Charger soils, which are on the uppermost portion of the proximal alluvial fans. These soils have a mollic epipedon, have a cambic horizon, and have gravel deposits at a depth of 40 to 80 inches (102 to 203 centimeters). Refer to general soil map unit 8.

Haploxerolls that are very deep or deep to an unrelated indurated duripan formed in alluvium weathered from volcanic rocks deposited over the fan terraces in areas north

of Mud Creek. These soils have a mollic epipedon and a cambic horizon. Refer to general soil map unit 9.

Thermic Soils on Fan Terraces

Refer to the reddish brown area in figure 29 and to general soil map unit 10.

Low fan terraces are slightly higher than and subtly grade uphill from mid and proximal alluvial fans. The soils on these fan terraces include Pachic Argixerolls, which are represented by Chico soils. These soils have older alluvial deposits and profile development than the soils on alluvial fans, indicating a longer period of stability. They have a thick mollic epipedon, a weak argillic horizon with an average of 25 to 35 percent clay, and base saturation of 95 to 100 percent. On the ground, it is difficult to distinguish the low fan terraces from the alluvial fans. A slight rise in topography is about the only observable feature that indicates the boundary.

Alluvial fan deposits eroded from the Tuscan Formation make up the Redbluff Formation, which is 0.45 to 1.1 million years old (Harwood, Helly, and Doukas, 1981). The soils currently on this landscape are remnants of perhaps much thicker and older soils that were removed or stripped away by catastrophic erosional events, or "blowouts." These fan terraces have been subject to various periods of deposition and erosion, evidenced by patterns of soils with depths ranging from very shallow to very deep and soils that are underlain by a thick, indurated, cobbly duripan. The duripan has been stripped away in many areas, exposing the underlying volcanic sediments.

At a higher elevation than the Chico soils are Mollic Haploxeralfs, which are represented by the very deep Redsluff soils. These soils formed in overbank alluvium deposited over channel alluvium on low fan terraces. They have an ochric epipedon, an argillic horizon with an average of 25 to 35 percent clay, and 2 to 25 percent rock fragments. The depth to extremely gravelly channel deposits ranges from 35 to 65 inches. Refer to general soil map unit 10.

Various periods of erosion and deposition are exhibited by Munjar soils, which are moderately deep to an extremely gravelly duripan and have a loamy-skeletal argillic horizon with 27 to 35 percent clay; the Tuscan taxadjunct, which is moderately deep to an extremely cobbly duripan and has an argillic horizon with 35 to 40 percent clay; and Anita soils, which are shallow to an indurated duripan, do not have rock fragments, and are clayey throughout.

Typic Durixeralfs occur on high fan terraces with a mound-swale microrelief in areas of the Redbluff Formation. These Durixeralfs include Redtough soils, which are shallow to an indurated duripan (fig. 25), have an ochric epipedon, have an argillic horizon with 18 to 27 percent clay, have redoximorphic features, have a fluctuating water table that is perched on the duripan, and are on mounds. Also included are Redswale soils, which are very shallow to an indurated duripan; have an ochric epipedon; have an argillic horizon with 18 to 25 percent clay; have redoximorphic features, such as manganese coatings on the duripan; have a fluctuating water table; and are in swales. Annual grasses and forbs make up the plant community because of saturation and a limited rooting depth. Refer to general soil map unit 10.

Thermic Soils on Cascade Foothills

Refer to the tan areas in figure 29 and to general soil map units 17 and 18.

The soils on the Cascade foothills formed directly over bedrock, mainly mudflow breccia (lahar) and volcanic sandstone, which make up the Tuscan Formation, about 1.3 to 3.3 million years old (Lydon, 1968). This landscape consists of long, nearly level to moderately sloping ridges and canyons with strongly sloping to very steep slopes and some areas of gently sloping canyon bottoms. Cliffs with nearly vertical slopes are common. The Tuscan Formation consists of four units (Helley and Harwood, 1985). Unit A, the oldest, consists of interbedded lahars, volcanic conglomerate, volcanic sandstone, and siltstone containing metamorphic rock fragments. Unit B consists of

interbedded lahars, volcanic conglomerate, and volcanic sandstone. Unit C consists of lahars with some interbedded volcanic conglomerate and sandstone. Unit D consists of fragmental deposits of andesite, basaltic andesite, pumice, and obsidian. Unit D is not exposed in this survey area.

Lithic Haploxeralfs occur on the lowest part of the foothills. They are represented by Doemill and Jokerst soils. Doemill soils are on mounds on ridgetops and on the side slopes of ridges. They are shallow to lithic mudflow breccia and have an ochric epipedon, an argillic horizon with 18 to 27 percent clay, 2 to 35 percent rock fragments, and a fluctuating water table that is perched on the hard bedrock. Redoximorphic features occur in the argillic horizon and coat the upper surface of the bedrock. Jokerst soils are in swales on ridgetops and on the side slopes of ridges. They are very shallow to lithic mudflow breccia. They have an ochric epipedon; an argillic horizon with 18 to 24 percent clay; 10 to 35 percent rock fragments; redoximorphic features, such as iron-manganese masses and concretions throughout and manganese coatings on the uppermost surface of the bedrock; and a fluctuating water table that extends from the bedrock to the surface of the soils. Base saturation ranges from 60 to 75 percent in the argillic horizon of both soils. The plant community consists of annual grasses and forbs because of saturation and a limited rooting depth. Refer to general soil map unit 17.

The soils on the mid-level foothills at elevations of about 200 to 1,700 feet (61 to 518 meters) include shallow Xerorthents, which have a paralithic contact of mudflow or a lithic contact of volcanic sandstone, and moderately deep or deep Typic Haploxeralfs, which are on side slopes and have an ochric epipedon, an argillic horizon with 27 to 45 percent clay, 15 to 65 percent rock fragments, base saturation of more than 75 percent, and a paralithic or lithic contact of mudflow or volcanic sandstone. Annual grasses and forbs, shrubs, blue oak, and foothill pine are characteristic of the vegetation in this zone. Refer to general soil map unit 18.

Mesic Soils on Cascade Foothills

Refer to the orange area in figure 29 and to general soil map unit 25.

The soil temperature regime changes from thermic to mesic at an elevation of about 1,220 feet (372 meters) on ridgetops and about 500 feet (152 meters) on north- and east-facing slopes in canyons. The soils on ridgetops include Lithic Xerorthents, which are represented by the very shallow Rockstripe soils. These soils have an ochric epipedon, a cambic horizon, base saturation of 50 to 75 percent, and a lithic contact of mudflow breccia. Other soils on these foothills include Ultic Haploxeralfs, mesic, which are moderately deep or deep to either a paralithic or lithic contact of mudflow breccia and have an ochric epipedon, an argillic horizon with 27 to 40 percent clay, and 5 to 80 percent rock fragments, and Ultic Haploxeralfs, which are moderately deep or deep to either a paralithic or lithic contact of volcanic conglomerate and have an ochric epipedon, an argillic horizon with 27 to 35 percent clay, and 10 to 50 percent rock fragments. These foothills are dominated by shrubs, annual grasses and forbs, foothill pine, and canyon live oak.

Mesic Soils on Cascade Mountains

Refer to the dark green area in figure 29 and to general soil map units 27, 28, and 29.

Upslope from the Cascade foothills is a zone with a mesic soil temperature regime and a plant community consisting mainly of ponderosa pine and California black oak. The soils in this zone include Andic Haploxeralfs, which are represented by the very deep Paradiso soils on ridgetops and the deep Schott soils on ridgetops and side slopes. Both of these soils have an ochric epipedon with andic material to a depth of

15 inches (38 centimeters) and have base saturation of 35 to 50 percent. Paradiso soils have an argillic horizon with 35 to 50 percent clay, and Schott soils have an argillic horizon with 18 to 35 percent clay. Andic Palexeralfs are represented by the very deep Tusccoll soils on backslopes in canyons. These soils have an ochric epipedon with andic material to a depth of 14 inches (36 centimeters), an argillic horizon with 22 to 35 percent clay (the content of clay increasing with increasing depth), and base saturation of 35 to 50 percent. Refer to general soil map unit 27.

The zone of maximum soil formation occurs at elevations between 2,000 and 4,000 feet (610 and 1,219 meters). Annual precipitation is more than 60 inches (1,524 millimeters), and temperatures are optimum for pedologic processes to function. The soils in this area are in the mesic temperature regime. The area is referred to as the "banana belt" by the survey soil scientists, because of the ideal climate, high forest productivity, and well developed soils. Precipitation changes from rain to snow at an elevation of about 4,000 feet (1,219 meters). This point is referred to as the "effective snow line." At elevations above this point, pedogenesis begins to slow down, mainly because of cooler temperatures.

Representing Andic Haplohumults in this area are the very deep Mountyana soils on ridgetops. These soils have an ochric epipedon with andic material to a depth of 9 inches (23 centimeters), a thick argillic horizon with 18 to 35 percent clay, and base saturation of less than 35 percent. Typic Haploxerands are represented by the very deep Beecee soils on the side slopes of ridges. These soils have andic soil properties from the surface to a depth of 22 inches (0 to 53 centimeters), an ochric epipedon, and a cambic horizon. Representing Andic Dystroxerepts are the moderately deep Lydon soils, which have an ochric epipedon with andic material at a depth of 1 to 6 inches (3 to 15 centimeters), a cambic horizon, and a lithic contact of mudflow breccia or andesite. A mixed conifer plant community occurs on these soils. Refer to general soil map unit 28.

Ultic Haploxerands are represented by the deep Redbone soils on ridgetops. These soils are in the mesic temperature regime bordering on the frigid temperature regime and have andic soil properties to a depth of 16 inches (41 centimeters), an ochric epipedon, an argillic horizon, and a paralithic contact of mudflow breccia. They support mixed conifers dominated by white fir. Refer to general soil map unit 29.

Frigid Soils on Cascade Mountains

Refer to the brown and turquoise areas in figure 29 and to general soil map units 36 and 39.

Representing Typic Haploxerands in these mountains are the deep Bonepile soils on ridgetops at elevations of 4,600 to 5,660 feet (1,402 to 1,725 meters) and extending down to 3,320 feet (1,012 meters) in canyons. These soils formed in tephra deposited over residuum and have andic soil properties throughout, an ochric epipedon, a cambic horizon, glassy mineralogy, base saturation of 10 to 15 percent, and a paralithic contact of andesite or mudflow breccia. They support mixed conifers dominated by white fir; hardwoods, such as California black oak; and shrubs. Refer to the brown area in figure 29 and to general soil map unit 36.

Haploxerands, volcanic till, and Haploxerands, granitic till, are on moraines at high elevations in both the Cascade and Sierra Nevada Mountains. These soils have andic soil properties from the surface to a depth of about 20 inches (51 centimeters), have an ochric epipedon and a cambic horizon, and are moderately deep to very deep to a densic horizon of glacial till. They support mixed conifers, dominantly white fir and red fir. Refer to the turquoise area on the far right side of figure 29 and to general soil map unit 39.

Sierra Nevada Developmental Sequence

This sequence includes soils on Feather River terraces, fan terraces, foothills, and mountains.

Thermic Soils on Feather River Terraces

Refer to the pink area in figure 30 and to general soil map unit 11.

The soils on Feather River terraces formed in sediments that make up the Modesto Formation, approximately 9,000 to probably 70,000 years BP (Busacca, 1982). This formation is divided into a younger, upper member (9,000 to 29,000 years BP) and an older, lower member (29,000 to probably 70,000 years BP).

Representing Typic Haploxerolls on these terraces are the very deep Liveoak soils in distributary channels. These soils have a mollic epipedon and have an argillic horizon with 18 to 25 percent clay. Typic Haploxeralfs, such as the very deep Boga soils, have an ochric epipedon, an argillic horizon with 25 to 35 percent clay, redoximorphic features, a densic horizon, and a fluctuating water table that is perched on top of the densic horizon. The deep Loemstone soils generally have the same characteristics as the Boga soils, with the exception of depth. The densic horizon consists of sediment and has a discontinuous silica-cemented cap. It is speculated that glacial Lake Mohawk was breached and its sediments (from the Tahoe glaciation) were eroded and transported down the Feather River. The silt and clay spread as a sheet of uniform thickness across several hundred square miles of the lower Modesto flood plain (Busacca, 1982). These soils support annual grasses, forbs, and valley oak.

Thermic Soils on Low Fan Terraces

Refer to the light red area in figure 30 and to general soil map unit 12.

Above the Feather River terraces are low fan terraces in areas of the Riverbank Formation, which dates back to 103,000 to 450,000 years BP (Busacca, 1982). This formation is divided into a younger, upper member and an older, lower member. The soils on these terraces formed in alluvial sediment deposited by the Feather River during glacial periods. During interglacial periods, landscape stability allowed soil formation to begin. The profile characteristics of the soils are believed to correspond to various interglacial periods. The loamy part of the profile, including the A1, A2, and BAt horizons, represents the upper member. A discontinuity consisting of an abrupt texture change to clay in the 2Bt horizon and the next discontinuity, an indurated duripan (3Bqm horizon), represent the lower member.

Representing Abruptic Durixeralfs on these terraces are the moderately deep Eastbiggs soils, which have an ochric epipedon, an argillic horizon with 35 to 50 percent clay, an abrupt texture change to clay at a depth of 17 inches (43 centimeters), an indurated duripan, redoximorphic features, and a fluctuating water table that is perched on top of the duripan. Mollic Palexeralfs are typified by the very deep Kimball soils on the tops of dissected terraces at elevations slightly higher than those of the Eastbiggs soils. Kimball soils have an ochric epipedon, an argillic horizon with 40 to 45 percent clay, and an abrupt texture change to red clay at a depth of 17 inches (43 centimeters). Both soils have relatively few rock fragments and support annual grasses and forbs. Kimball soils also support valley oak.

Thermic Soils on Intermediate Fan Terraces

Refer to the dark red area in figure 30 and to general soil map unit 13.

Above the low fan terraces are intermediate fan terraces in areas of the Laguna Formation, which dates back to 1.7 to 3.6 million years BP (Busacca, 1982). This formation is divided into a younger, upper member and an older, lower member. The upper member has a gravelly cap that is recognized as part of the formation. The lower member consists of coarse alluvium, including fragments the size of stones,

cobbles, and gravel that were deposited by the Feather River. These deposits are exposed near Sycamore Hill, and this area is thought to be the location of the main channel of the Feather River at the time when the lower unit was being deposited. Following a change in base level, the Feather River cut through metavolcanic rocks, defining its present channel and depositing upper member alluvium.

The topography of the Laguna Formation is characterized by low, rolling, dissected hills with isolated remnant knobs. Observation of the soils indicates that there were various periods of deposition, soil formation, erosion, more deposition, soil formation, more erosion that stripped away the duripan, and more deposition that filled in channels and areas where the duripan was removed. The soils have well developed profiles with very strongly expressed diagnostic horizons. They are very shallow to very deep to a duripan. This variability of soil depth commonly occurs within a very short distance. There are "windows" where the duripan has been stripped away.

Aquic Durixeralfs on these terraces are represented by the moderately deep Oroville soils in swales. These soils have an aquic moisture regime; an ochric epipedon; an argillic horizon with 35 to 50 percent clay and 2 to 35 percent gravel; an abrupt texture change to gravelly clay at a depth of 13 inches (33 centimeters); an indurated, extremely gravelly duripan; redoximorphic features; and a fluctuating water table that is perched on top of the duripan. Representing Abruptic Durixeralfs are the moderately deep Thermalito soils on mounds. These soils have an ochric epipedon; an argillic horizon with 24 to 35 percent clay and 2 to 30 percent gravel; an abrupt texture change to gravelly clay at a depth of 25 inches (64 centimeters); an indurated, gravelly duripan; redoximorphic features; and a fluctuating water table that is perched on top of the duripan. Typifying Ultic Palexeralfs are the very deep Fernandez soils on the top of dissected terraces. These soils have an ochric epipedon, an argillic horizon with 20 to 35 percent clay and 0 to 20 percent gravel, an abrupt texture change to red clay at a depth of 44 inches (112 centimeters), base saturation of less than 75 percent, and a weakly cemented, gravelly duripan. They are believed to represent channels that were refilled with sediment. Vegetation consists of annual grasses and forbs.

A high fan terrace is dominantly associated with the lower member of the Laguna Formation, though the upper member also occurs. Ultic Palexeralfs on this terrace are represented by the very deep Thompsonflat soils. These soils have an ochric epipedon and an argillic horizon with 23 to 34 percent clay and 4 to 34 percent rock fragments and are 22 to 75 inches (56 to 190 centimeters) deep to extremely gravelly layers that have secondary silica. Vegetation consists of annual grasses and blue oak.

Thermic Soils on Sierra Nevada Foothills

Refer to the light yellow, greenish yellow, and gray areas in figure 30 and to general soil map units 14, 19, 20, 21, 23, and 24.

Directly uphill and east of the high fan terraces are the Sierra Nevada foothills consisting of metamorphic rocks that are on the Smartville Complex. This complex, which dates back to 159 million to 164 million years BP (Schiffman and Wagner, 1992), consists mainly of greenschist, gabbro, gabbro diorite, diorite, and some quartz diorite.

Ultic Haploxeralfs, such as the shallow Dunstone and moderately deep Loafercreek soils, occur on the lower portion of the foothills, at elevations of 200 to 2,400 feet (61 to 732 meters). These soils have an ochric epipedon, an argillic horizon with 18 to 33 percent clay and as much as 50 percent silt, 3 to 33 percent rock fragments, base saturation of 60 to 85 percent, and a paralithic contact of greenschist. The soils support two plant communities, one consisting mainly of annual grasses, forbs, and blue oak and the other consisting mainly of shrubs, hardwoods, and foothill pine. Refer to general soil map units 19 and 20.

Above the low metamorphic foothills is a zonal sequence of metamorphic foothills at elevations of 1,200 to 2,000 feet (366 to 610 meters). Representing Ultic Haploxeralfs

in this zone are the deep Mounthope soils, which have an ochric epipedon, an argillic horizon with 20 to 27 percent clay and as much as 50 percent silt, 10 to 35 percent rock fragments, and a paralithic contact of green schist. Ultic Palexeralfs are typified by the very deep Hartsmill soils, which have the same diagnostic horizons as the Mounthope soils but have an argillic horizon with 35 to 50 percent rock fragments and a clay content that does not decrease in the lower part. The Hartsmill soils support dense shrub-hardwood plant communities with scattered ponderosa pine. Refer to the light yellow area in figure 30 and to general soil map unit 21.

The Smartville Complex includes the Swedesflat Pluton, which consists of gabbro, gabbro diorite, diorite, and some quartz diorite. Ultic Haploxeralfs are on this pluton. Examples are the moderately deep Flanly and shallow Swedesflat soils, which have an ochric epipedon, an argillic horizon with 15 to 30 percent clay, 4 to 25 percent rock fragments, base saturation of 40 to 74 percent, and a paralithic contact of quartz diorite. Representing Ultic Palexeralfs are the very deep Parkshill soils. These soils have diagnostic horizons similar to those of the Flanly and Swedesflat soils, but the content of clay does not decrease in the lower part of the argillic horizon. Parkshill soils support annual grass-shrub-hardwood plant communities with scattered foothill pine. Refer to the greenish yellow area in figure 30 and to general soil map unit 23.

Soils on the low portion of the Bald Rock Pluton formed in residuum and colluvium derived from trondhjemite. Examples are Typic Haploxerepts, such as the very deep Crystalhill and moderately deep Oregongulch soils, which have an ochric epipedon, a cambic horizon with 12 to 18 percent clay and 20 to 35 percent rock fragments, and a densic contact of trondhjemite. The densic contact has rock structure and, when observed in road cuts, appears to be a paralithic contact. It is a densic contact, however, because it slakes in water. Representing Ultic Haploxeralfs are the deep Craigsaddle soils, which have an ochric epipedon, an argillic horizon with 18 to 27 percent clay, and a densic contact. The soils on the low portion of the Bald Rock Pluton support dense shrubs, hardwoods, and conifers. Refer to the greenish yellow area in figure 30 and to general soil map unit 24.

Directly north of the fan terraces is Table Mountain, a prominent feature that formed by exposure of Lovejoy basalt (of Miocene age) and that rises like an island above the surrounding area. Table Mountain has unique soils and a landscape that is far different from that of the surrounding area. Water has worked this plateau, eroding hard basalt back from the edges and forming several canyons (hollows). Representing Oxyaquic Haplohumults on this landscape are the moderately deep Elsey soils on mounds. These soils have an umbric epipedon, an argillic horizon with base saturation of less than 7 percent, a lithic contact of basalt, redoximorphic features, and a fluctuating water table. Lithic Haplohumults are typified by the shallow Beatsonhollow soils in swales. These soils have an umbric epipedon, an argillic horizon with base saturation of less than 7 percent, a lithic contact of basalt, redoximorphic features, and a fluctuating water table. Ultic Argixerolls are represented by the deep Campbellhills soils in joint fractures on the top of basalt plateaus. These soils have a mollic epipedon, an argillic horizon, a lithic contact of basalt, and a fluctuating water table that is perched on the lithic contact. The soils on Table Mountain support a diverse plant community of annual grasses and forbs on top of the basalt plateau and annual grasses, forbs, shrubs, hardwoods, and some conifers in canyons. Refer to the gray area northwest of Lake Oroville in figure 30 and to general soil map unit 14.

Directly below the Lovejoy basalt on Table Mountain are sediments of the Ione Formation (of Eocene age). These sediments are associated with auriferous gravel that was hydraulically mined for gold. The Ione sediments consist of sand and clay layers that have weathered to form soils represented by very deep Palexerults, which have an argillic horizon with an average of 26 to 40 percent kaolinitic clay and have a densic contact of claystone. Refer to the gray area northwest of Lake Oroville in figure 30 and to general soil map unit 14.

Mesic Soils on Sierra Nevada Mountains

Refer to the light green, dark green, and pale green areas in figure 30 and to general soil map units 31, 33, 34, and 35.

Soils that formed under optimum conditions favoring deeply developed profiles are at an elevation of 2,200 to 4,375 feet (671 to 1,334 meters). These soils formed in residuum and colluvium derived from metavolcanic rocks, metadiorite, diorite, and gabbro ranging in age from Jurassic to Permian. In this zone, high amounts of precipitation and relatively warm temperatures have developed fairly uniform soil properties despite the type of rock from which the parent material of the soils is derived. Andic Haplohumults, such as the fine textured Toadtown and fine-loamy Powellton soils, have an ochric epipedon, andic material extending to a depth of about 15 inches (38 centimeters), and an argillic horizon with base saturation of 10 to 35 percent. Representing Xeric Kanhaplohumults are the deep Rogerville soils, which formed in residuum and colluvium derived from ultramafic rocks, mainly talc schist. These soils have an ochric epipedon, an argillic horizon with 36 to 50 percent clay and base saturation of 20 to 35 percent, and a paralithic contact of talc schist. They support a highly productive mixed conifer forest. Refer to the light green area in figure 30 and to general soil map unit 31.

A variety of soils have formed in residuum and colluvium on the Bald Rock Cascade, Concow, and Grizzly Plutons, which are Cretaceous, dating back to 128 to 142 million years BP (Hietanen, 1976). Typic Dystroxerepts, such as the very deep Islandbar soils, the shallow, loamy Chawanakee soils, and the very deep Bonneyridge soils, are typical of the soils that formed in granitic parent materials. They have an ochric epipedon, a cambic horizon, and less than 18 percent clay (a coarse-loamy particle-size class). The very deep Featherfalls soils, which show evidence of differential weathering and represent Ultic Palexeralfs, have an ochric epipedon and have an argillic horizon with 20 to 27 percent clay. The content of clay does not decrease in the lower part of the argillic horizon. Andic Haploxerults are represented by the very deep Lewisflat soils, which have an ochric epipedon, an argillic horizon with 18 to 27 percent clay, and base saturation of 9 to 32 percent. Islandbar and Featherfalls soils occur at elevations of 900 to 3,175 feet (274 to 968 meters). Bonneyridge and Lewisflat soils occur at elevations of 3,100 to 4,600 feet (945 to 1,402 meters) and in some areas down to 1,680 feet (512 meters). Refer to the dark green area in figure 30 and to general soil map units 33 and 34.

The Cascade Pluton has Sierra Nevada volcanic lava flows of Lovejoy basalt, which are of Miocene age (22.2 million years BP) and are buried by tephra. The soils on this pluton include Humic Haploxerands, such as the very deep Shakeridge and deep Timberisland soils on ridgetops and side slopes. These soils have a mollic epipedon, andic soil properties extending to a depth of more than 40 inches (102 centimeters), a cambic horizon, and ferrihydritic mineralogy. Base saturation is more than 50 percent because bases are released as basalt fragments weather. Representing Alfic Humic Haploxerands are the very deep Mudwash soils on ridgetops and side slopes. These soils have a thick umbric epipedon, andic soil properties extending to a depth of 26 inches, an argillic horizon, and a paralithic contact of basalt or mudflow. Refer to the pale green area in figure 30 and to general soil map unit 35.

Frigid Soils on Sierra Nevada Mountains

Refer to the olive green and blue green areas in the lower right part of figure 30 and to general soil map units 37 and 38.

Lovejoy basalt flows are underlain by Sierra Nevada volcanic pyroclastic mudflows, which are of Pliocene age, dating back to 2 to 6 million years BP (Hietanen, 1976), and are buried by tephra of unknown origin. The soils on these mountains include Humic Haploxerands, such as the moderately deep, medial-skeletal Powderhouse soils, the moderately deep, medial Greenwell soils, and the deep, medial-skeletal

McNair soils. These soils have an umbric epipedon, andic soil properties extending from the surface through most of the profile, a cambic horizon, and a paralithic contact of mudflow. Base saturation ranges from 10 to 35 percent. The content of organic matter ranges from 4 to 35 percent. It is highest in the A horizon. Refer to the olive green area in figure 30 and to general soil map unit 37.

At the highest elevation in this sequence, soils formed in material derived from Sierra Nevada metamorphic rocks, which are designated as the Franklin Canyon Formation and estimated to be of Devonian age, about 360 to 415 million years BP (Hietanen, 1976). Representing Andic Haplohumults on ridgetops and side slopes are the very deep Dejonah soils, which have an ochric epipedon with andic material to a depth of 10 inches (25 centimeters), an argillic horizon with 18 to 27 percent clay, 5 to 30 percent rock fragments, and base saturation of 10 to 25 percent. The very deep Stagpoint soils generally have the same properties as the Dejonah soils, but the content of rock fragments ranges from 41 to 58 percent. Both soils have 8 to 17 percent organic matter in the upper 10 inches (25 centimeters). This high-elevation area supports conifers dominated by white fir and red fir. Refer to the blue green area in figure 30 and to general soil map unit 38.

Glossary

AASHTO classification. A system for classifying soils specifically for geotechnical engineering purposes that is related to highway and airfield construction. It is based on particle-size distribution and Atterberg limits.

AASHTO group index (GI). An empirical index number used to evaluate clayey and silty clay material.

Aeration, soil. The exchange of air in soil with air from the atmosphere. The air in a well aerated soil is similar to that in the atmosphere; the air in a poorly aerated soil is considerably higher in carbon dioxide and lower in oxygen.

Aggregate, soil. Many fine particles held in a single mass or cluster. Natural soil aggregates, such as granules, blocks, or prisms, are called peds. Clods are aggregates produced by tillage or logging.

Alkali (sodic) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Allophane. An amorphous clay mineral; a hydrous alumino-silicate gel of highly variable composition.

Alluvial fan. A low, outspread mass of loose material and/or rock material washed down the sides of mountains and hills. It commonly has gentle slopes and is shaped like an open fan or a segment of a cone. It is deposited by a stream at the place where the stream issues from a narrow mountain valley or where a tributary stream is near or at its junction with the main stream. An alluvial fan is steepest near its apex that points upstream, and it slopes gently and convexly outward with a gradual decrease in gradient.

Alluvium. Material, such as sand, silt, or clay, deposited on land by streams.

Alpha,alpha-dipyridyl. A dye that when dissolved in 1N ammonium acetate is used to detect the presence of reduced iron (Fe II) in the soil. A positive reaction indicates a type of redoximorphic feature.

Aquic conditions. Current soil wetness characterized by saturation, reduction, and redoximorphic features.

Andesite. A dark, fine grained extrusive rock that, when porphyritic, contains phenocrysts composed primarily of zoned sodic plagioclase (especially andesine) and one or more of the mafic minerals (e.g., biotite, hornblende, and pyroxene), with a ground mass composed generally of the same minerals as the phenocrysts; the extrusive equivalent of diorite.

Andic materials. Soil materials that have properties influenced by the weathering of tephra and volcanic glass but are not diagnostic andic soil properties. Commonly, layers of weathered volcanic ash that are too thin or are not weathered sufficiently to have formed allophane or imogolite.

Andic soil properties. Soil properties resulting from the presence of significant amounts of allophone, imogolite, ferrihydrate, or aluminum-humus complexes in soils. These materials, termed “amorphous,” are commonly formed during the weathering of tephra and other parent materials with a significant content of volcanic glass.

Anthropogenic soils. Soils that have been altered by human activity. Examples are soils that formed in human-transported or human-manufactured materials, soils

that have had all diagnostic horizons destroyed in-situ by one-time or periodic human chemical or mechanical disturbance, soils in excavated areas, and paddy soils and other soils in which ongoing genesis is strongly influenced by nearly continuous human activity.

Argillic horizon. A subsoil horizon characterized by an accumulation of illuvial clay.

Ash, volcanic. Unconsolidated pyroclastic material less than 2 millimeters in all dimensions.

Aspect. The direction in which a slope faces.

ASTM standard D2487-00. Refers to a system of classifying mineral and organo-mineral soils for engineering purposes based on laboratory determination of particle-size characteristics, liquid limit, and plastic index. ASTM means American Society for Testing and Materials.

Available water capacity (available moisture capacity). The volume of water that should be available to plants if the soil, inclusive of rock fragments, were at field capacity. It is commonly estimated as the difference between the amount of water at field capacity and the amount at wilting point with adjustments for salinity, rock fragments, and rooting depth. It is commonly expressed as inches of water per inch of soil. The capacity, in inches, in a 60-inch profile or to a limiting layer is expressed as:

Very low	0 to 2.5
Low	2.5 to 5.0
Moderate	5.0 to 7.5
High	7.5 to 10.0
Very high	more than 10.0

AWC. See Available water capacity.

Backslope. The hillslope profile position that forms the steepest and generally linear, middle portion of the slope. In profile, backslopes commonly are bounded by a convex shoulder above and a concave footslope below. They may or may not include cliff segments, or free faces. Backslopes are commonly erosional forms produced by mass movement, colluvial action, and running water.

Bar (microfeature). A small, sinuous or arcuate, ridgelike lineation separated from others similar to it by small channels. It is caused by fluvial processes and is common on flood plains and young alluvial terraces. It is a constituent of bar-and-channel topography.

Bar (streams). A general term for a ridgelike accumulation of sand, gravel, or other alluvial material in the channel, along the banks, or at the mouth of a stream where a decrease in velocity induces deposition. Examples are channel bars and meander bars.

Bar-and-channel topography. A local topography of recurring, small, sinuous or arcuate ridges separated by shallow troughs irregularly spaced across low-relief flood plains (slopes generally are 2 to 6 percent). The effect is a subdued, sinuously undulating surface that is common on active flood plains. Micro-elevational differences generally range from less than 1 meter to less than 2 meters. The elevational differences between the bars and channels are largely controlled by the competency of the stream. The ridgelike bars commonly consist of sediment that is coarser than the finer textured sediment of the low-lying areas.

Basal area. The area of a cross section of a tree, generally referring to the section at breast height and measured outside the bark. It is a measure of stand density, commonly expressed in square feet.

Basal till. Compact glacial till deposited beneath the ice.

Basalt. A dark igneous rock, commonly extrusive, composed primarily of calcic plagioclase and pyroxene; the fine grained equivalent of gabbro.

Base saturation. The degree to which material having cation-exchange properties is saturated with exchangeable bases (sum of Ca, Mg, Na, and K), expressed as a percentage of the total cation-exchange capacity.

Basin. The nearly level or gently sloping bottom surface of a wide structural depression between mountain ranges.

Batholith. A large body of igneous intrusive (plutonic) rock, commonly regional in extent, such as the Sierra Nevada Batholith.

Beach terrace. A landform that consists of a wave-cut scarp and wave-built terrace of well sorted marine and lacustrine sand and gravel. Colloquially, in the western United States, the relict shoreline from pluvial lakes, generally restricted to the sides of valleys.

Bedding planes. Fine strata, less than 5 millimeters thick, in unconsolidated alluvial, eolian, lacustrine, or marine sediment.

Bedrock. A general term for the solid rock that underlies the soil and other unconsolidated material or that is exposed at the surface. *Densic bedrock* is noncemented, extremely weathered, or soft because of the nature of the rock. *Lithic bedrock* is indurated, very strongly cemented , or strongly cemented. An example is hard bedrock, which impedes the downward movement of water and restricts root penetration. *Paralithic bedrock* is moderately cemented, weakly cemented, very weakly cemented, or extremely weakly cemented. An example is soft bedrock, such as sandstone, mudstone, or strongly weathered bedrock.

Bedrock-controlled topography. A landscape where the configuration and relief of the landforms are determined or strongly influenced by the underlying bedrock.

Bench. A platformlike, nearly level or gently sloping erosional surface developed on resistant strata where canyons are downcut by streams. Structural benches are bedrock controlled.

Bisequum. Two sequences of soil horizons, each of which consists of an illuvial horizon and the overlying eluvial horizons.

Bottom land. The normal flood plain of a stream, subject to flooding.

Boulders. Rock fragments larger than 24 inches (more than 600 millimeters) in diameter.

Breast height. An average height of 4.5 feet above the ground surface; the point on a tree where diameter measurements are ordinarily taken.

Breccia. A coarse grained clastic rock composed of angular, broken rock fragments held together by a mineral cement or a fine grained matrix, e.g., volcanic breccia.

Brush management. Use of mechanical, chemical, or biological methods to make conditions favorable for reseeding or to reduce or eliminate competition from woody vegetation and thus allow understory grasses and forbs to recover. Brush management increases forage production and thus reduces the hazard of erosion. It can improve the habitat for some species of wildlife.

Bulk density. A measurement of the oven-dry weight of the soil material that is less than 2 millimeters in diameter per unit volume. Common measurements are taken at $^{1}/_{3}$-, $^{1}/_{10}$-, or 15-bar moisture tension. Bulk density influences plant growth and engineering applications. It is used to convert measurements from a weight basis to a volume basis. Within a family particle-size class, bulk density is an indicator of how well plant roots are able to extend into the soil. Bulk density is used to calculate porosity.

Butte. An isolated, generally flat-topped hill or mountain with relatively steep slopes and talus or precipitous cliffs. It is characterized by a summit width that is less than the height of bounding escarpments, is commonly topped by a cap of resistant rock, and represents an erosional remnant carved from flat-lying rock.

Cable yarding. A method of moving felled trees to a nearby central area for transport to a processing facility. Most cable yarding systems involve use of a drum, a pole, and wire cables in an arrangement similar to that of a rod and reel used for fishing.

To reduce friction and soil disturbance, felled trees generally are reeled in while one end is lifted or the entire log is suspended.

Calcareous soil. A soil containing enough calcium carbonate (commonly combined with magnesium carbonate) to effervesce visibly when treated with cold, dilute hydrochloric acid.

Calcic horizon. A mineral soil horizon of secondary carbonate enrichment that is more than 15 centimeters thick, has a calcium carbonate equivalent of more than 15 percent, and has a calcium carbonate equivalent at least 5 percent higher than the underlying horizon.

Calcium carbonate equivalent. The amount of calcium carbonate in a soil measured by treating the soil sample with hydrochloric acid (HCL). The evolved carbon dioxide (CO_2) is measured, and the amount of carbonate is then calculated as calcium carbonate ($CaCO_3$).

California bearing ratio (CBR). The load-supporting capacity of a soil as compared to that of standard crushed limestone, expressed as a ratio. First standardized in California. A soil having a CBR of 16 supports 16 percent of the load that would be supported by standard crushed limestone, per unit area, with the same degree of distortion.

Cambic horizon. A mineral soil horizon that has the texture of loamy very fine sand or finer, has soil structure rather than rock structure, and contains some weatherable minerals. It is characterized by the alteration or removal of mineral material as indicated by mottling or gray color, stronger chroma or redder hue than the underlying horizons, or the removal of carbonates. The cambic horizon lacks cementation or induration and has too few evidences of illuviation to meet the requirements for an argillic horizon.

Canopy. The leafy crown of trees or shrubs. (See Crown.)

Canyon. A long, deep, narrow, very steep sided valley with high, precipitous walls in an area of high local relief.

Capillary water. Water held as a film around soil particles and in tiny spaces between particles. Surface tension is the adhesive force that holds capillary water in the soil.

Catena. A sequence of soils on a landscape that are about the same age and formed in similar kinds of parent material under similar climatic conditions but have different characteristics as a result of differences in relief and drainage.

Cathodic protection. Control of the electrolytic corrosion of an underground or underwater metallic structure, such as a pipeline, by the application of an electrical current in such a way that the structure acts as the cathode rather than the anode of an electrolytic cell. (See Coatings for pipelines.)

Cation. An ion carrying a positive charge of electricity. The common soil cations are calcium, potassium, magnesium, sodium, and hydrogen.

Cation-exchange capacity (CEC). The total amount of exchangeable cations that can be held by the soil, expressed in terms of milliequivalents per 100 grams of soil at neutrality (pH 7.0) or at some other stated pH value. The term, as applied to soils, is synonymous with base-exchange capacity but is more precise in meaning.

Caving potential. The potential for cut banks in shallow excavations to cave in or collapse.

CEC. See Cation-exchange capacity.

Chemical treatment. Control of unwanted vegetation through the use of chemicals.

Cirque. A semicircular, concave, bowllike area that has steep faces primarily resulting from the erosiveness of a mountain glacier.

Clast. An individual constituent, grain, or fragment of a detrital sediment or sedimentary rock produced by the physical disintegration of a larger rock mass.

Clay. As a soil separate, the mineral soil particles less than 0.002 millimeter in diameter. As a soil textural class, soil material that is 40 percent or more clay, less than 45 percent sand, and less than 40 percent silt.

Clay depletions. Low-chroma zones having a low content of iron, manganese, and clay because of the chemical reduction of iron and manganese and the removal of iron, manganese, and clay. A type of redoximorphic depletion.

Clay film. A thin coating of oriented clay on the surface of a soil aggregate or lining pores or root channels. Synonyms: clay coating, clay skin.

Clayey. Includes the texture classes sandy clay, silty clay, and clay.

Claypan. A dense, compact, slowly permeable layer in the subsoil that has a much higher content of clay than the overlying material. A claypan commonly is hard when dry and plastic or sticky when wet.

Climax plant community. The stabilized plant community on a particular site. The plant cover reproduces itself and does not change so long as the environment remains the same.

Coarse fragments. See Rock fragments.

Coarse textured soil. Sand or loamy sand.

Coatings for pipelines. Coatings used as a barrier to the flow of electricity and moisture, thereby preventing the formation of corrosion cells.

Cobble (or cobblestone). A rounded or partly rounded fragment of rock 3 to 10 inches (75 to 250 millimeters) in diameter.

Cobbly soil material. Material that has 15 to 35 percent, by volume, rounded or partially rounded rock fragments 3 to 10 inches (75 to 250 millimeters) in diameter. Very cobbly soil material has 35 to 60 percent of these rock fragments, and extremely cobbly soil material has more than 60 percent.

COLE (coefficient of linear extensibility). See Linear extensibility percent.

Colluvium. Unconsolidated, unsorted earth material transported or deposited on side slopes and/or at the base of slopes by mass movement, or direct gravitational action, and by local unconcentrated runoff.

Compaction. The process by which the soil grains are rearranged to decrease void space and bring them into closer contact with one another, thereby increasing bulk density.

Complex slope. Irregular or variable slope. Planning or establishing terraces, diversions, and other water-control structures on a complex slope is difficult.

Complex, soil. A map unit of two or more kinds of soil or miscellaneous areas in such an intricate pattern or so small in area that it is not practical to map them separately at the selected scale of mapping. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas.

Concretions. Cemented bodies with crude internal symmetry organized around a point, a line, or a plane. They typically take the form of concentric layers visible to the naked eye. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up concretions. If formed in place, concretions of iron oxide or manganese oxide are generally considered a type of redoximorphic concentration.

Conglomerate. A coarse grained, clastic sedimentary rock composed of rounded or subangular rock fragments more than 2 millimeters in diameter, commonly with a matrix of sand and finer textured material. Cementing agents include silica, calcium carbonate, and iron oxide. Conglomerate is the consolidated equivalent of gravel.

Consistence, soil. Refers to the degree of cohesion and adhesion of soil material and its resistance to deformation when ruptured. Consistence includes resistance of soil material to rupture and to penetration; plasticity, toughness, and stickiness of puddled soil material; and the manner in which the soil material behaves when subject to compression. Terms describing consistence are defined in the “Soil Survey Manual.”

Control section. The part of the soil on which classification is based. The thickness varies among different kinds of soil, but for many it is that part of the soil profile between depths of 10 inches and 40 or 80 inches.

Corrosion. Soil-induced electrochemical or chemical action that dissolves or weakens concrete or uncoated steel.

Crown. The upper part of a tree or shrub, including the living branches and their foliage.

Cryoturbation. A collective term used to describe all soil movement as a result of frost action, including the folding, breaking, and dislocating of beds and lenses of unconsolidated material.

Culmination of the mean annual increment (CMAI). The average annual increase per acre in the volume of a stand. Computed by dividing the total volume of the stand by its age. As the stand increases in age, the mean annual increment continues to increase until mortality begins to reduce the rate of increase. The point where the stand reaches its maximum annual rate of growth is called the culmination of the mean annual increment.

Debris flow (mass movement). The process, associated sediment (debris flow deposit), or resultant landform characterized by a very rapid type of flow dominated by sudden downslope movement of a mass of rock, soil, and mud (more than 50 percent particles that are more than 2 millimeters in size) that behaves much like viscous fluid whether it is saturated or relatively dry.

Deep soil. See Depth, soil.

Densic contact. The contact between soil and dense materials that are relatively unaltered and are not cemented. The dense materials are commonly volcanic mudflow, glacial till, or extremely weathered bedrock.

Depth, soil. Generally, the thickness of the soil over a restrictive layer. Very deep soils are more than 60 inches deep over a restrictive layer; deep soils, 40 to 60 inches; moderately deep, 20 to 40 inches; shallow, 10 to 20 inches; and very shallow, less than 10 inches.

Distal alluvial fan. The portion of an alluvial fan where relatively fine textured alluvium is deposited farthest from the source area.

Drainage class (natural). Refers to the frequency and duration of wet periods under conditions similar to those under which the soil formed. Alterations of the water regime by human activities, either through drainage or irrigation, are not a consideration unless they have significantly changed the morphology of the soil. Seven classes of natural soil drainage are recognized—*excessively drained, somewhat excessively drained, well drained, moderately well drained, somewhat poorly drained, poorly drained,* and *very poorly drained*. These classes are defined in the "Soil Survey Manual."

Drainage, surface. Runoff, or surface flow of water, from an area.

Drainageway. A general term for a course or channel along which water moves in draining an area.

Draw. A small stream channel that generally is more open and has a broader floor than a ravine or gulch.

Drift. Pulverized and other rock material transported by glacial ice and then deposited. Also, the sorted and unsorted material deposited by streams flowing from glaciers.

Duff. A generally firm organic layer on the surface of mineral soils. It consists of fallen plant material that is in the process of decomposition and includes everything from the litter on the surface to underlying pure humus.

Duripan. A subsurface soil horizon that is cemented with illuvial silica, commonly opal or microcrystalline forms, to the degree that less than 50 percent of the volume of air-dry fragments will slake in water or hydrochloric acid. The duripan impedes the downward movement of water and restricts root growth. Water perches or stacks on the pan, resulting in a high water table.

EC. See Electrical conductivity.

Ecological site. An area where climate, soil, and relief are sufficiently uniform to produce a distinct natural plant community. An ecological site is the product of all the environmental factors responsible for its development. It is typified by an association of species that differ from those on other ecological sites in kind and/or proportion of species or in total production.

Electrical conductivity (EC). The electrolytic conductivity of an extract from saturated soil paste.

Eluviation. The movement of material in true solution or colloidal suspension from one place to another within the soil. Soil horizons that have lost material through eluviation are eluvial; those that have received material are illuvial.

Endosaturation. A type of saturation of the soil in which all horizons between the upper boundary of saturation and a depth of 2 meters are saturated.

Eolian material. Material transported and deposited by wind, including earth material such as dune sand, sand sheets, loess, and clay.

Ephemeral stream. A stream, or reach of a stream, that flows only in direct response to precipitation. It receives no long-continued supply from melting snow or other source, and its channel is above the water table at all times.

Epiclastic. Refers to mechanically deposited sediments (gravel, sand, and mud) consisting of the weathered products of older rocks.

Episaturation. A type of saturation indicating a perched water table in a soil in which saturated layers are underlain by one or more unsaturated layers within 2 meters of the surface.

Erosion. The wearing away of the land surface by water, wind, ice, or other geologic agents and by such processes as gravitational creep.

Erosion (geologic). Erosion caused by geologic processes acting over long geologic periods and resulting in the wearing away of mountains and the building up of such landscape features as flood plains and coastal plains. Synonym: natural erosion.

Erosion (accelerated). Erosion much more rapid than geologic erosion, mainly as a result of human or animal activities or of a catastrophe in nature, such as a fire, that exposes the surface.

Erosion pavement. A concentration of gravel or coarser fragments that remains on the soil surface after finer particles have been removed by running water or wind.

Escarpment. A relatively continuous and steep slope or cliff breaking the general continuity of more gently sloping land surfaces and resulting from erosion or faulting. The term is most commonly applied to cliffs produced by differential erosion. Synonym: scarp.

Extremely stony soil material. Material that has more than 50 percent stones, by volume.

Extrusive. Pertaining to igneous rock and sediment derived from deep-seated molten matter (magma) deposited and cooled on the earth's surface, including lava flows and tephra deposits.

Facies. The aspect, appearance, and characteristics of a rock unit, generally reflecting the conditions of its origin.

Family, soil. The most specific hierarchical category in soil taxonomy.

Fan remnant. A general term for landforms that are the remaining parts of older fan landforms, such as alluvial fans, fan aprons, inset fans, and fan skirts, that either have been dissected (erosional fan remnants) or partially buried (nonburied fan remnants). An erosional fan remnant has a relatively flat summit that is a relict fan surface. A nonburied fan remnant is a relict surface in its entirety.

Fan terrace. See Fan remnant.

Fertility, soil. The quality that enables a soil to provide plant nutrients, in adequate amounts and in proper balance, for the growth of specified plants when light, moisture, temperature, tilth, and other growth factors are favorable.

Fibric soil material (peat). The least decomposed of all organic soil material. Peat contains a large amount of well preserved fiber that is readily identifiable according to botanical origin. Peat has the lowest bulk density and the highest water content at saturation of all organic soil material.

Field moisture capacity. The moisture content of a soil, expressed as a percentage of the ovendry weight, after the gravitational, or free, water has drained away; the field moisture content 2 or 3 days after a soaking rain; also called *normal field capacity, normal moisture capacity,* or *capillary capacity*.

Fill slope. A sloping surface consisting of excavated soil material from a road cut. It commonly is on the downhill side of the road.

Fine textured soil. Sandy clay, silty clay, or clay.

Firebreak. Area cleared of flammable material to stop or help control creeping or running fires. It also serves as a line from which to work and to facilitate the movement of firefighters and equipment. Designated roads also serve as firebreaks.

Flood basin. A broad, flat area between a sloping plain and the natural levee of a river; occupied primarily by clayey soils.

Flood plain. The nearly level plain that borders a stream and is subject to inundation under flood-stage conditions unless protected artificially. It is commonly a constructional landform consisting of sediment deposited during overflow and lateral migration of a stream.

Fluvial. Of or pertaining to rivers; produced by river action.

Foothill. A steeply sloping upland that has relief of as much as 1,000 feet (300 meters) and fringes a mountain range or high-plateau escarpment.

Footslope. The position that forms the inner, gently inclined surface at the base of a hillslope. In profile, footslopes are commonly concave. A footslope is a transition zone between upslope sites of erosion and transport (shoulders and backslopes) and downslope sites of deposition (toeslopes).

Forb. Any herbaceous plant not a grass or a sedge.

Forest cover. All trees and other woody plants (underbrush) covering the ground in a forest.

Forest type. A stand of trees similar in composition and development because of given physical and biological factors by which it may be differentiated from other stands.

Formation (geologic). A body of rock strata that consists dominantly of a certain lithologic type or combinations of types. Formations may be combined into groups or subdivided into members.

Fragments. Unattached cemented pieces of bedrock, bedrocklike material, durinodes, concretions, and nodules 2 millimeters in diameter or larger in mineral soils; woody material 20 millimeters in diameter or larger in organic soils.

Frigid temperature regime. See Temperature regime, soil.

Frost action, potential.. The potential for frost action is the susceptibility of the soil to upward or lateral movement by the formation of segregated ice lenses. It includes the potential for frost heave and the subsequent loss of soil strength when the ground thaws.

Genesis, soil. The mode of origin of the soil. Refers especially to the processes or soil-forming factors responsible for the formation of the solum, or true soil, from the unconsolidated parent material.

Gilgai. The microrelief of soils produced by expansion and contraction with changes in moisture content. It is characteristic of soils containing large amounts of smectitic clay and that swell and shrink considerably with wetting and drying.

Glacial. Of or pertaining to the presence and activity of ice and glaciers, such as glacial erosion; pertaining to distinctive features and material produced by or derived from glaciers and ice sheets, such as glacial lakes; or pertaining to an ice age or region of glaciation.
Glacial drift. See Drift.
Glacial outwash. See Outwash.
Glacial till. See Till.
Glaciofluvial deposits. Material moved by glaciers and subsequently sorted and deposited by streams flowing from the melting ice. The deposits are stratified and occur as outwash plains, valley trains, deltas, kames, eskers, and kame terraces.
Glaciolacustrine deposits. Material ranging from fine clay to sand derived from glaciers and deposited in glacial lakes mainly by glacial meltwater. Many deposits are interbedded or laminated with varves or rhythmites.
Gleyed soil. Soil that formed under poor drainage, resulting in the reduction of iron and other elements in the profile and in gray colors.
Granite. A felsic igneous intrusive rock containing quartz and orthoclase with smaller amounts of sodic plagioclase and commonly muscovite.
Granitic. A textural term commonly pertaining to an igneous intrusive rock of felsic to intermediate composition. Referring to granitelike rock, but not necessarily true granite. Commonly applied to granite, quartz monzonite, granodiorite, and diorite.
Granodiorite. An igneous intrusive rock that is intermediate between felsic and mafic in composition and contains quartz and somewhat more plagioclase than orthoclase.
Gravel. Rounded or angular fragments of rock as much as 3 inches (2 to 75 millimeters) in diameter. An individual piece is a pebble.
Gravelly soil material. Material that has 15 to 35 percent, by volume, rounded or angular rock fragments, not prominently flattened, as much as 3 inches (75 millimeters) in diameter.
Ground water. Water filling all the unblocked pores of the material below the water table.
Gully. A small channel with steep sides cut by the concentrated, but intermittent, flow of water commonly during and immediately following heavy rainfall or following icemelt or snowmelt. A gully generally is an obstacle to wheeled vehicles and is too deep to be obliterated by ordinary tillage; a rill is of lesser depth and can be smoothed over by ordinary tillage.
Gypsum content. The percent, by weight, of hydrated calcium sulfates in the fraction of the soil less than 20 millimeters in size.
Hard bedrock. Bedrock that cannot be excavated except by blasting or by the use of special equipment that is not commonly used in construction.
Hardpan. A hardened or cemented soil horizon, or layer. The soil material is sandy, loamy, or clayey and is cemented by iron oxide, silica, calcium carbonate, or other substance.
Hemic soil material (mucky peat). Organic soil material intermediate in degree of decomposition between the less decomposed fibric material and the more decomposed sapric material.
High terrace. The highest position of a steplike fan terrace. It is between an intermediate fan terrace and a foothill.
High water table. See Water table.
Hill. A generic term for an area of the land surface that rises as much as 1,000 feet (300 meters) above surrounding lowlands, commonly has restricted summit area relative to surrounding surfaces, and has a well defined outline; hillsides generally have slopes of more than 15 percent. The distinction between a hill and a mountain is arbitrary and commonly is dependent on local usage.

Holocene. The epoch of the Quaternary period of geologic time that extends from the end of the Pleistocene (about 10 to 12 thousand years ago) to the present.

Horizon, soil. A layer of soil, approximately parallel to the surface, having distinct characteristics produced by soil-forming processes. In the identification of soil horizons, an uppercase letter represents the major horizons. Numbers or lowercase letters that follow represent subdivisions of the major horizons. An explanation of the subdivisions is given in the "Soil Survey Manual." The major horizons of mineral soil are as follows:

O horizon.—An organic layer of fresh and decaying plant residue.

A horizon.—The mineral horizon at or near the surface in which an accumulation of humified organic matter is mixed with the mineral material. Also, a plowed surface horizon, most of which was originally part of a B horizon.

E horizon.—The mineral horizon in which the main feature is loss of silicate clay, iron, aluminum, or some combination of these.

B horizon.—The mineral horizon below an A horizon. The B horizon is in part a layer of transition from the overlying A to the underlying C horizon. The B horizon also has distinctive characteristics, such as (1) accumulation of clay, sesquioxides, humus, or a combination of these; (2) prismatic or blocky structure; (3) redder or browner colors than those in the A horizon; or (4) a combination of these.

C horizon.—The mineral horizon or layer, excluding indurated bedrock, that is little affected by soil-forming processes and does not have the properties typical of the overlying soil material. The material of a C horizon may be either like or unlike that in which the solum formed. If the material is known to differ from that in the solum, an Arabic numeral, commonly a 2, precedes the letter C.

Cr horizon.—Soft, consolidated bedrock beneath the soil.

R layer.—Consolidated bedrock beneath the soil. The bedrock commonly underlies a C horizon, but it can be directly below an A or a B horizon.

Humus. The well decomposed, more or less stable part of the organic matter in mineral soils.

Hydric soils. Soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part.

Hydrologic soil groups. Refers to soils grouped according to their runoff potential. The soil properties that influence this potential are those that affect the minimum rate of water infiltration on a bare soil during periods after prolonged wetting when the soil is not frozen. These properties are depth to a seasonal high water table, the infiltration rate and permeability after prolonged wetting, and depth to a very slowly permeable layer. The slope and the kind of plant cover are not considered but are separate factors in predicting runoff.

Igneous rock. Rock formed by solidification from a molten or partially molten state. Major varieties include intrusive and extrusive rock. Examples are andesite and basalt.

Illuviation. The movement of soil material from one horizon to another in the soil profile. Generally, material is removed from an upper horizon and deposited in a lower horizon.

Impervious soil. A soil through which water, air, or roots penetrate slowly or not at all. No soil is absolutely impervious to air and water all the time.

Index surface runoff. A concept that indicates the relative potential loss of water from an area by flow over the land under specific conditions. It is assumed that the surface of the soil is bare, the steady ponded infiltration rate is the applicable infiltration stage, the soil moisture state is very moist or wet, bulk density is within the limits of the mapping concept, and the standard storm or amount of water addition from snowmelt is 50 millimeters in a 24-hour period with no more than 25 millimeters in any single 1-hour period.

Infiltration. The downward entry of water into the immediate surface of soil or other material, as contrasted with percolation, which is movement of water through soil layers or material.

Infiltration capacity. The maximum rate at which water can infiltrate into a soil under a given set of conditions.

Infiltration rate. The rate at which water penetrates the surface of the soil at any given instant, usually expressed in inches per hour. The rate can be limited by the infiltration capacity of the soil or the rate at which water is applied at the surface.

Intake rate. The average rate of water entering the soil under irrigation. Most soils have a fast initial rate; the rate decreases with application time. Therefore, intake rate for design purposes is not a constant but is a variable depending on the net irrigation application. The rate of water intake, in inches per hour, is expressed as follows:

Less than 0.2	very low
0.2 to 0.4	low
0.4 to 0.75	moderately low
0.75 to 1.25	moderate
1.25 to 1.75	moderately high
1.75 to 2.5	high
More than 2.5	very high

Intermediate terrace. The middle position of a steplike fan terrace. It is between a low fan terrace and high fan terrace.

Intermittent stream. A stream, or reach of a stream, that does not flow year-round (commonly is dry for 3 months or more annually). Its channel generally is below the local water table. The stream flows only when it receives base flow during wet periods or when it receives ground-water discharge or long, continued contributions from melting snow or other surface and shallow subsurface sources.

Intrusive. Pertaining to igneous rock derived from molten matter (magma) that invaded pre-existing rock and cooled below the surface of the earth.

Iron depletions. Low-chroma zones having a low content of iron and manganese oxide because of chemical reduction and removal, but having a clay content similar to that of the adjacent matrix. A type of redoximorphic depletion.

K factor. A measurement of potential soil erodibility caused by detachment of soil particles by water.

Kaolinitic. A mineralogy class term used to indicate that the dominant clay mineral is kaolinite. The mineral has a 1:1 layer structure composed of aluminum silicates.

Kf. See Soil erodibility factors.

Knoll. A small, low, rounded hill rising above adjacent landforms.

Ksat. See Saturated hydraulic conductivity.

Kw. See Soil erodibility factors.

Lahar. The process, associated sediments, or resultant landform characterized by a mudflow composed chiefly of volcaniclastic materials on or near the flank of a volcano. The debris carried in the flow includes pyroclastic material, blocks from primary lava flows, and epiclastic material.

Landslide. The rapid downhill movement of a mass of soil and loose rock, generally when wet or saturated. The speed and distance of movement, as well as the amount of soil and rock material, vary greatly.

Lava flow. A solidified body of rock formed from the lateral, surficial outpouring of molten lava from a vent or fissure; commonly lobate in form.

Leaching. The removal of soluble material from soil or other material by percolating water.

LEP. See Linear extensibility percent.

Linear extensibility percent (LEP). The linear expression of the volume difference between the water content of the natural soil fabric at 1/3-bar or 1/10-bar and oven dryness. The volume change is reported as a percent for the whole soil. Soil composed of 2 to 1: clay, such as smectite, shrinks when dry, forming cracks, and swells when it becomes moist or wet, closing the cracks Shrink-swell potential classes are *low*, LEP of less than 3 and COLE of less than 0.03; *moderate*, LEP of 3 to less than 6 and COLE of 0.03 to less than 0.06; *high*, LEP of 6 to less than 9 and COLE of 0.06 to less than 0.09; and *very high*, LEP of 9 or more and COLE of 0.09 or more.

Liquid limit (LL). The moisture content at which the soil passes from a plastic to a liquid state.

Lithic contact. The boundary between soil and coherent underlying material. When moist, this material is impractical to dig with a spade. It is indurated, very strongly cemented, or strongly cemented and commonly is hard or relatively unweathered bedrock.

Lithologic discontinuity. A significant change in particle-size distribution or mineralogy that indicates differences in lithology within a soil. The term can also denote an age difference. Evidence of lithologic discontinuity includes abrupt texture contacts, contrasting sand sizes, a bedrock lithology that differs from the lithology of rock fragments in the soil, stone lines, distribution of rock fragments, weathering rinds on rock fragments, shape of rocks, soil color, or the presence of micromorphological features.

LL. See Liquid limit.

Loam. Soil material that is 7 to 27 percent clay particles, 28 to 50 percent silt particles, and less than 52 percent sand particles.

Loamy. Includes the texture classes coarse sandy loam, sandy loam, fine sandy loam, very fine sandy loam, loam, silt loam, silt, clay loam, sandy clay loam, and silty clay loam.

Low strength. The soil is not strong enough to support loads.

Low terrace. The lowest position of a steplike fan terrace. It is between a basin and an intermediate fan terrace.

Magma. Molten rock material that originates deep in the earth and solidifies to form igneous rock.

Masses. Concentrations of substances in the soil matrix that do not have a clearly defined boundary with the surrounding soil material and cannot be removed as a discrete unit. Common compounds making up masses are calcium carbonate, gypsum or other soluble salts, iron oxide, and manganese oxide. Masses consisting of iron oxide or manganese oxide generally are considered a type of redoximorphic concentration.

Meander belt. The zone within which migration of a meandering channel occurs; the flood-plain area included between two imaginary lines drawn tangential to the outer bends of active channel loops. Landform components of the meander-belt surface are produced by a combination of gradual (lateral and down valley) migration of meander loops and avulsive channel shifts causing abrupt cutoffs of loop segments.

Mechanical treatment. Use of mechanical equipment for seeding, brush management, and other management practices.

Medium textured soil. Very fine sandy loam, loam, silt loam, or silt.

Mesic temperature regime. See Temperature regime, soil.

Metamorphic rock. Rock of any origin altered in mineralogical composition, chemical composition, or structure by heat, pressure, and movement in the earth's crust. Nearly all such rocks are crystalline. Examples are schist, gneiss, quartzite, slate, and marble.

Metamorphism. The mineralogical, chemical, and structural adjustment of solid rocks to physical and chemical conditions imposed at depth below the surface zones of weathering and cementation. These conditions differ from the conditions under which the rocks originated.

Metasediment. A sediment or sedimentary rock that shows evidence of having been subjected to metamorphism.

Metavolcanic rock. A volcanic rock that shows evidence of metamorphism but has not been fully metamorphosed into metamorphic rock.

Mid fan. The portion of an alluvial fan between the proximal and distal portions where relatively medium textured alluvium is deposited.

Mineral soil. Soil that is mainly mineral material and low in organic material. Its bulk density is more than that of organic soil.

Miscellaneous area. An area that has little or no natural soil and supports little or no vegetation.

Moderately coarse textured soil. Coarse sandy loam, sandy loam, or fine sandy loam.

Moderately deep soil. See Depth, soil.

Moderately fine textured soil. Clay loam, sandy clay loam, or silty clay loam.

Mollic epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has high base saturation and pedogenic soil structure. It may include the upper part of the subsoil.

Moraine (landform). A general term for a landform composed mainly of till deposited by either an active or extinct glacier. Some types are disintegration, end, lateral, recessional, and terminal.

Morphology, soil. The physical makeup of the soil, including the texture, structure, porosity, consistence, color, and other physical, mineral, and biological properties of the various horizons, and the thickness and arrangement of those horizons in the soil profile.

Mound-swale microrelief. Circular or oval domes, generally 0.2 foot to 2 feet in height and 1 to 10 feet in diameter, with intervening basin-shaped depressions that commonly do not have external drainage. Also referred to as hogwallow or mima mounds in the western United States.

Mountain. A natural elevation of the land surface that rises more than 1,000 feet (300 meters) above surrounding lowlands, commonly has limited summit area relative to surrounding surfaces, and generally has steep sides (slopes of more than 25 percent) with or without considerable bare-rock surface. A mountain can occur as a single, isolated mass or in a group forming a chain or range. Mountains are formed primarily by tectonic and/or volcanic activity and by differential erosion.

Muck. Unconsolidated soil material consisting primarily of highly decomposed organic material in which the original plants are not recognizable. It generally contains more mineral material and is darker than peat. (See Sapric soil material.)

Mudflow. The process, associated sediment (mudflow deposit), or resultant landform characterized by a very rapid type of earthflow dominated by a sudden, downslope movement of a saturated mass of rock, soil, and mud (in which more than 50 percent of the particles are less 2 millimeters in size) that behaves much as a viscous fluid.

Mudstone. A blocky or massive, fine grained sedimentary rock indurated by clay and silt in approximately equal amounts. Also, a general term for clay, silt, claystone, siltstone, shale, and argillite that is used only when the amounts of clay and silt are not known or cannot be precisely determined.

Munsell notation. A designation of color by degrees of three simple variables—hue, value, and chroma. For example, a notation of 10YR 6/4 is a color with hue of 10YR, value of 6, and chroma of 4.

Natural drainage class. See Drainage class.

Neutral soil. A soil having a pH value of 6.6 to 7.3. (See Reaction, soil.)
Nodules. Cemented bodies lacking visible internal structure. Calcium carbonate, iron oxide, and manganese oxide are common compounds making up nodules. If formed in place, nodules of iron oxide or manganese oxide are considered types of redoximorphic concentrations.
Nose slope. A geomorphic component of hills consisting of the projecting end (laterally convex area) of a hillside. The overland waterflow is predominantly divergent.
Nutrient, plant. Any element taken in by a plant essential to its growth. Plant nutrients are mainly nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, manganese, copper, boron, and zinc obtained from the soil and carbon, hydrogen, and oxygen obtained from the air and water.
Ochric epipedon. A dark, thin surface horizon or a light colored surface horizon that fails to meet the criteria for any of the other epipedons.
OM. See Organic matter.
Organic matter. Plant and animal residue in the soil in various stages of decomposition.
Outwash. Gravel, sand, and silt, commonly stratified, deposited by glacial meltwater.
Outwash plain. An extensive lowland area of coarse textured glaciofluvial material. An outwash plain commonly is smooth; where pitted as a result of the melting of incorporated ice masses, it generally has low relief.
Oxbow. A closely looping stream meander having a curvature so extreme that only a neck of land is left between the two parts of the stream.
Paleosol. A soil that formed in a particular area with distinctive morphological features resulting from a soil-forming environment that no longer exists in the area. The pedogenic process was either altered as a result of external environmental changes or interrupted by burial. A paleosol (or component horizon) is classified as relict if it has persisted without major alteration of morphology by the prevailing pedogenic environment. An exhumed paleosol is one that was buried and has been re-exposed by erosion of the mantle. Most paleosols have been affected by some subsequent modification of the morphology of diagnostic horizons and truncation of the profile.
Pan. A compact, dense layer in a soil that impedes the movement of water and the growth of roots. For example, *hardpan, fragipan, claypan, plowpan,* and *traffic pan*.
Paralithic contact. A contact between soil and relatively unaltered materials that are extremely weakly cemented to moderately cemented. Commonly, these materials are partially weathered or are soft bedrock.
Parent material. The unconsolidated and chemically weathered mineral and organic material in which the solum of a soil is formed as a result of pedogenic processes.
Peat. Unconsolidated soil material consisting largely of undecomposed or slightly decomposed organic matter that has accumulated under excessive moisture conditions. (See Fibric soil material.)
Ped. An individual natural soil aggregate, such as a granule, a prism, or a block.
Pedogenic. Pertaining to processes that add, transfer, transform, or remove soil constituents. Pedology is the scientific study of soils, including their origins, characteristics, and uses.
Pedon. The smallest volume that can be called “a soil.” A pedon is three dimensional and large enough to permit study of all horizons. Its area ranges from about 10 to 100 square feet (1 to 10 square meters), depending on the variability of the soil.
Perched water table. The upper surface of unconfined ground water separated from an underlying main body of ground water by an unsaturated zone.
Percolation. The downward movement of water through the soil.
Permafrost. Soil or rock that has remained at or below 0 degrees C for at least 2 years. It is defined on the basis of temperature and is not necessarily frozen.

Permeability. The quality of the soil that enables water or air to move downward through the profile. The rate at which a saturated soil transmits water is accepted as a measure of this quality. In soil physics, the rate is referred to as "saturated hydraulic conductivity," which is defined in the "Soil Survey Manual." In line with conventional usage in the engineering profession and with traditional usage in published soil surveys, this rate of flow continues to be expressed as "permeability." Terms describing permeability, measured in inches per hour, are as follows:

Impermeable	less than 0.0015 inch
Very slow	0.0015 to less than 0.06 inch
Slow	0.06 to less than 0.2 inch
Moderately slow	0.2 to less than 0.6 inch
Moderate	0.6 inch to less than 2.0 inches
Moderately rapid	2.0 to less than 6.0 inches
Rapid	6.0 to 20 inches
Very rapid	more than 20 inches

In micrometers per second (um/sec), the measurements are as follows:

Impermeable	less than 0.01 um/sec
Very slow	0.01 to less than 0.42 um/sec
Slow	0.42 to less than 1.4 um/sec
Moderately slow	1.4 to less than 4.2 um/sec
Moderate	4.2 to less than 14.1 um/sec
Moderately rapid	14.1 to less than 42.3 um/sec
Rapid	42.3 to 141 um/sec
Very rapid	more than 141 um/sec

pH value. A numerical designation of acidity and alkalinity in soil. (See Reaction, soil.)

Phase, soil. A subdivision of a soil series based on features that affect its use and management, such as slope, stoniness, and flooding.

PI. See Plasticity index.

Piedmont (noun). An area, plain, slope, glacier, or other feature at the base of a mountain; for example, a foothill or bajada. In the United States, the Piedmont is a low plateau that extends from New Jersey to Alabama and lies east of the Appalachian Mountains.

Plastic limit. The moisture content at which a soil changes from semisolid to plastic.

Plasticity index (PI). The numerical difference between the liquid limit and the plastic limit; the range of moisture content within which the soil remains plastic.

Plateau. A comparatively flat area of great extent and elevation. Specifically, an extensive land region considerably elevated (more than 100 meters) above adjacent lower lying terrain that is commonly limited on at least one side by an abrupt descent and has a flat or nearly level surface. A relatively large part of a plateau surface is near summit level.

Pleistocene. The epoch of the Quaternary period of geologic time following the Pliocene and preceding the Holocene (approximately 2 million to 10 thousand years ago). Also refers to the corresponding (time-stratigraphic) "series" of earth material.

Pluton. A deep-seated igneous intrusion.

Ponding. Standing water on soils in closed depressions. Unless the soils are artificially drained, the water can be removed only by percolation or evapotranspiration.

Poorly graded. Refers to a coarse grained soil or soil material consisting mainly of particles of nearly the same size. Because there is little difference in size of the particles, density can be increased only slightly by compaction.

Potential native plant community. See Climax plant community.

Potential rooting depth (effective rooting depth). The depth to which roots could penetrate if the content of moisture in the soil were adequate. The soil has no properties restricting the penetration of roots to this depth.

Prescribed burning. Deliberately burning an area for specific management purposes, under the appropriate conditions of weather and soil moisture and at the proper time of day.

Productivity, soil. The capability of a soil for producing a specified plant or sequence of plants under specific management.

Profile, soil. A vertical section of the soil extending through all its horizons and into the parent material.

Proper grazing use. Grazing at an intensity that maintains enough cover to protect the soil and maintain or improve the quantity and quality of the desirable vegetation. This practice increases the vigor and reproduction capacity of the key plants and promotes the accumulation of litter and mulch necessary to conserve soil and water.

Proximal alluvial fan. The portion of an alluvial fan where relatively coarse textured alluvium is deposited closest to the source area.

Pyroclastic. Pertaining to fragmental material produced by commonly explosive aerial ejection of clastic particles from a volcanic vent. Such material may accumulate on land or under water.

Rangeland. Land on which the potential natural vegetation is predominantly grasses, grasslike plants, forbs, or shrubs. It includes natural grasslands, savannas, many wetlands, some deserts, tundras, and areas that support certain forb and shrub communities.

Reach (stream). A length of a stream used as a unit of study. It has a specified feature that is fairly uniform throughout, such as hydraulic characteristics or flood damage. Reaches are physically defined at each end by cross sections that include the channel and the flood plain. The upstream end is called the head, and the downstream end is called the foot.

Reaction, soil. A measure of acidity or alkalinity of a soil, expressed in pH values. A soil that tests to pH 7.0 is described as precisely neutral in reaction because it is neither acid nor alkaline. The degrees of acidity or alkalinity, expressed as pH values, are:

Ultra acid	less than 3.5
Extremely acid	3.5 to 4.4
Very strongly acid	4.5 to 5.0
Strongly acid	5.1 to 5.5
Moderately acid	5.6 to 6.0
Slightly acid	6.1 to 6.5
Neutral	6.6 to 7.3
Slightly alkaline	7.4 to 7.8
Moderately alkaline	7.9 to 8.4
Strongly alkaline	8.5 to 9.0
Very strongly alkaline	9.1 and higher

Redoximorphic concentrations. Nodules, concretions, soft masses, pore linings, and other features resulting from the accumulation of iron or manganese oxide. An indication of chemical reduction and oxidation resulting from saturation.

Redoximorphic depletions. Low-chroma zones from which iron and manganese oxide or a combination of iron and manganese oxide and clay has been removed. These zones are indications of the chemical reduction of iron resulting from saturation.

Redoximorphic features. Redoximorphic concentrations, redoximorphic depletions, reduced matrices, a positive reaction to alpha,alpha-dipyridyl, and other features indicating the chemical reduction and oxidation of iron and manganese compounds resulting from saturation.

Reduced matrix. A soil matrix that has low chroma in situ because of chemically reduced iron (Fe II). The chemical reduction results from nearly continuous wetness. The matrix undergoes a change in hue or chroma within 30 minutes after exposure to air as the iron is oxidized (Fe III). A type of redoximorphic feature.

Regolith. All unconsolidated earth material above the solid bedrock. It includes material weathered in place from all kinds of bedrock and alluvial, glacial, eolian, lacustrine, and pyroclastic deposits. Soil scientists regard as soil only that part of the regolith that has been modified by organisms and soil-forming processes. Most engineers describe the entire regolith, even to a great depth, as "soil."

Relief. The elevations or inequalities of a land surface, considered collectively.

Remnant. The remaining part of a larger landform or land surface that has been dissected or partially buried.

Residuum (residual soil material). Unconsolidated, weathered or partly weathered mineral material that accumulated as consolidated rock disintegrated in place.

Restrictive feature. A nearly continuous layer that has one or more physical, chemical, or thermal properties that significantly restrict the movement of water and air through the soil or that otherwise provide an unfavorable root environment. Common forms include cemented layers, dense layers, abrupt or stratified layers, and strongly contrasting textures. Examples are a duripan, lithic bedrock, and paralithic bedrock.

Rhyolite. Extrusive igneous rock, generally porphyritic and exhibiting flow texture, with phenocrysts of quartz and alkali feldspar in a glassy cryptocrystalline ground mass. The extrusive equivalent of granite.

Rill. A small, steep-sided channel resulting from erosion. It is cut by a concentrated, but intermittent, flow of water, usually during and immediately following moderate rains or following icemelt or snowmelt. Generally, a rill is not an obstacle to wheeled vehicles and is shallow enough to be obliterated by ordinary tillage.

Riverwash. Barren alluvial areas of unstabilized sand, silt, clay, or gravel reworked frequently by stream activity.

Road cut. A sloping surface produced by mechanical means during road construction. It is commonly on the uphill side of the road.

Rock fragments. Rock or mineral fragments having a diameter of 2 millimeters or more; for example, pebbles, cobbles, stones, and boulders.

Rock outcrop. Exposures of bedrock, excluding lava and rock-lined pits.

Root zone. The part of the soil that can be penetrated by plant roots.

Runoff. The precipitation discharged into stream channels from an area. The water that flows off the surface of the land without sinking into the soil is called surface runoff. Water that enters the soil before reaching surface streams is called ground-water runoff or seepage flow from ground water.

Saline soil. A soil containing soluble salts in an amount that impairs the growth of plants. A saline soil does not contain excess exchangeable sodium. Salinity is

expressed as the electrical conductivity of a saturation extract at 25 degrees C. Salinity classes, expressed in millimhos per centimeter, are as follows:

Nonsaline	0 to 2
Very slightly saline	2 to 4
Slightly saline	4 to 8
Moderately saline	8 to 16
Strongly saline	more than 16

Saline-sodic soil. A soil that contains sufficient exchangeable sodium to interfere with the growth of most crops and appreciable quantities of soluble salts. The exchangeable sodium ratio is greater than 0.15; the conductivity of the soil solution, when saturated, is greater than 4 decisiemens per meter (at 25 degrees C); and the pH is commonly 8.5 or less when the soil is saturated.

Sand. As a soil separate, individual rock or mineral fragments from 0.05 millimeter to 2.0 millimeters in diameter. Most sand grains consist of quartz. As a soil textural class, a soil that is 85 percent or more sand and not more than 10 percent clay.

Sandstone. Sedimentary rock containing dominantly sand-sized particles.

Sandy. Includes the texture classes sand and loamy sand.

Sapric soil material (muck). The most highly decomposed of all organic soil material. Muck has the least amount of plant fiber, the highest bulk density, and the lowest water content at saturation of all organic soil material.

Saprolite. Soft, friable, isovolumetrically weathered bedrock that retains the fabric and structure of the parent rock and exhibits extensive intercrystal and intracrystal weathering. In pedology, the term “saprolite” has been used to refer to any unconsolidated residual material that underlies the soil and grades to hard bedrock below.

SAR. See Sodium adsorption ratio.

Saturated hydraulic conductivity (Ksat). The ease with which pores in a saturated soil transmit water. Ksat classes, expressed in terms of micrometers per second (um/sec), are as follows:

Very low	less than 0.01
Low	0.01 to less than 0.1
Moderately low	0.1 to less than 1
Moderately high	1 to less than 10
High	10 to 100
Very high	more than 100

In inches per hour, the measurements are as follows:

Very low	less than 0.001417
Low	0.001417 to less than 0.01417
Moderately low	0.01417 to less than 0.1417
Moderately high	0.1417 to less than 1.417
High	1.417 to 14.17
Very high	more than 14.17

Saturation. Wetness characterized by zero or positive pressure of the soil water. Under conditions of saturation, the water will flow from the soil matrix into an unlined auger hole.

Scarification. The act of abrading, scratching, loosening, crushing, or modifying the surface to increase water absorption or to provide a more tillable soil.

Sedimentary rock. A consolidated deposit of clastic particles, chemical precipitates, or organic matter accumulated at or near the surface of the earth under “normal”

low temperature and pressure conditions. Sedimentary rock includes the consolidated equivalents of alluvial, colluvial, drift, eolian, lacustrine, and marine deposits. Examples are sandstone, siltstone, mudstone, claystone, shale, conglomerate, limestone, dolomite, and coal.

Sequum. A sequence consisting of an illuvial horizon and the overlying eluvial horizon. (See Eluviation.)

Series, soil. A group of soils that have profiles that are almost alike, except for differences in texture of the surface layer. All the soils of a series have horizons that are similar in composition, thickness, and arrangement.

Shale. Sedimentary rock that formed as a result of the induration of a clay, silty clay, or silty clay loam deposit and has the tendency to split into thin layers (fissility).

Shallow soil. See Depth, soil.

Sheet erosion. The removal of a fairly uniform layer of soil material from the land surface by the action of rainfall and surface runoff.

Shrink-swell potential. See Linear extensibility percent.

Shoulder. The position that forms the uppermost inclined surface near the top of a hillslope. It is a transition from backslope to summit. The surface is dominantly convex in profile and erosional in origin.

Side slope. A geomorphic component of hills consisting of a laterally planar area of a hillside. The overland waterflow is predominantly parallel.

Silica. A combination of silicon and oxygen. The mineral form is called quartz.

Silica-sesquioxide ratio. The ratio of the number of molecules of silica to the number of molecules of alumina and iron oxide. The more highly weathered soils or their clay fractions in warm-temperate, humid regions, and especially those in the tropics, generally have a low ratio.

Silt. As a soil separate, individual mineral particles that range in diameter from the upper limit of clay (0.002 millimeter) to the lower limit of very fine sand (0.05 millimeter). As a soil textural class, soil that is 80 percent or more silt and less than 12 percent clay.

Similar soils. Soils that share limits of diagnostic criteria, behave and perform in a similar manner, and have similar conservation needs or management requirements for the major land uses in the survey area.

Site index. A designation of the quality of a forest site based on the height of the dominant stand at an arbitrarily chosen age. For example, if the average height attained by dominant and codominant trees in a fully stocked stand at the age of 50 years is 75 feet, the site index is 75.

Slickensides. Polished and grooved surfaces produced by one mass sliding past another. In soils, slickensides may occur at the bases of slip surfaces on the steeper slopes; on faces of blocks, prisms, and columns; and in swelling clayey soils, where there is marked change in moisture content.

Slope. The inclination of the land surface from the horizontal. Percentage of slope is the vertical distance divided by horizontal distance, then multiplied by 100. Thus, a slope of 20 percent is a drop of 20 feet in 100 feet of horizontal distance. In this survey, classes for simple slopes are as follows:

Level	0 to 1 percent
Nearly level	0 to 2 percent
Gently sloping	2 to 5 percent
Moderately sloping	5 to 8 percent
Strongly sloping	8 to 15 percent
Moderately steep	15 to 30 percent
Steep	30 to 50 percent
Very steep	more than 50 percent

Classes for complex slopes are as follows:

Level	0 to 1 percent
Nearly level	0 to 2 percent
Undulating	2 to 5 percent
Gently rolling	5 to 8 percent
Rolling	8 to 15 percent
Hilly	15 to 30 percent
Steep	30 to 50 percent
Very steep	more than 50 percent

Sodic (alkali) soil. A soil having so high a degree of alkalinity (pH 8.5 or higher) or so high a percentage of exchangeable sodium (15 percent or more of the total exchangeable bases), or both, that plant growth is restricted.

Sodicity. The degree to which a soil is affected by exchangeable sodium. Sodicity is expressed as a sodium adsorption ratio (SAR) of a saturation extract, or the ratio of Na^{+} to $Ca^{++} + Mg^{++}$. The degrees of sodicity and their respective ratios are:

Nonsodic	0-5:1
Very slightly sodic	5-13:1
Slightly sodic	13-30:1
Moderately sodic	30-45:1
Strongly sodic	45-90:1
Very strongly sodic	more than 90:1

Sodium adsorption ratio (SAR). A measure of the amount of sodium (Na) relative to calcium (Ca) and magnesium (Mg) in the water extract from saturated soil paste. It is the ratio of the Na concentration divided by the square root of one-half of the Ca + Mg concentration.

Soft bedrock. Bedrock that can be excavated with trenching machines, backhoes, small rippers, and other equipment commonly used in construction.

Soil. A natural, three-dimensional body at the earth's surface. It is capable of supporting plants and has properties resulting from the integrated effect of climate and living matter acting on earthy parent material, as conditioned by relief over periods of time.

Soil erodibility factors. The Kw and Kf factors quantify the susceptibility of soil to detachment by water. These erodibility factors predict the long-term average soil loss that results from sheet and rill erosion when various cropping systems and conservation techniques are used. The whole soil is considered in the Kw factor, but only the fine-earth fraction, which is the material less than 2 millimeters in diameter, is considered in the Kf factor.

Soil separates. Mineral particles less than 2 millimeters in equivalent diameter and ranging between specified size limits. The names and sizes, in millimeters, of separates recognized in the United States are as follows:

Very coarse sand	2.0 to 1.0
Coarse sand	1.0 to 0.5
Medium sand	0.5 to 0.25
Fine sand	0.25 to 0.10
Very fine sand	0.10 to 0.05
Silt	0.05 to 0.002
Clay	less than 0.002

Solum. The upper part of a soil profile, above the C horizon, in which the processes of soil formation are active. The solum in soil consists of the A, E, and B horizons. Generally, the characteristics of the material in these horizons are unlike those of

the material below the solum. The living roots and plant and animal activities are largely confined to the solum.

Stone line. A sheetlike lag concentration of rock fragments in surficial sediment. In cross section, the line may be marked only by scattered fragments or it may be a discrete layer of fragments. The fragments are more commonly pebbles or cobbles than stones. A stone line generally overlies material that was subject to weathering, soil formation, and erosion before deposition of the overlying material. Many stone lines appear to be buried erosion pavement originally formed by running water on the land surface and concurrently covered by surficial sediment.

Stones. Rock fragments 10 to 24 inches (250 to 600 millimeters) in diameter if rounded.

Stony. Refers to a soil containing stones in numbers that interfere with or prevent tillage.

Stony soil material. Material that has 15 to 35 percent stones, by volume.

Strath terrace. A stream terrace that formed as an erosional surface cut on bedrock and that is thinly mantled with stream deposits (alluvium).

Stratified. Referring to geologic deposits that were formed, arranged, or laid down in layers. Layers in soils that are a result of the processes of soil formation are called horizons; those inherited from the parent material are called strata.

Stream terrace. One of a series of platforms in a stream valley that flanks and is more or less parallel to the stream channel, originally formed near the level of the stream, and represents the dissected remnants of an abandoned flood plain, streambed, or valley floor produced during an earlier period of erosion or deposition.

Structure, soil. The arrangement of primary soil particles into compound particles or aggregates. The principal forms of soil structure are—*platy* (laminated), *prismatic* (vertical axis of aggregates longer than horizontal), *columnar* (prisms with rounded tops), *blocky* (angular or subangular), and *granular*. *Structureless* soils are either *single grained* (each grain by itself, as in dune sand) or *massive* (the particles adhering without any regular cleavage, as in many hardpans).

Subsoil. Technically, the B horizon; roughly, the part of the solum below plow depth.

Substratum. The part of the soil below the solum.

Subsurface layer. Any surface soil horizon (A, E, AB, or EB) below the surface layer.

Summit. The topographically highest position of a hillslope. It has a nearly level (planar or only slightly convex) surface.

Surface layer. The soil ordinarily moved in tillage, or its equivalent in uncultivated soil, ranging in depth from 4 to 10 inches (10 to 25 centimeters). Frequently designated as the “plow layer,” or the “Ap horizon.”

Surface runoff. See Index surface runoff.

Surface soil. The A, E, AB, and EB horizons, considered collectively. It includes all subdivisions of these horizons.

T factor. The soil loss tolerance, which is defined as the maximum amount of erosion at which the quality of a soil as a medium for plant growth can be maintained. Maintaining the quality of the soil includes maintaining the surface soil as a seedbed for plants, maintaining the atmosphere-soil interface to allow the entry of air and water into the soil and still protect the underlying soil from wind and water erosion, and maintaining the total soil volume as a reservoir for water and plant nutrients, which is preserved by minimizing soil loss.

Talus. Rock fragments of any size or shape (commonly coarse and angular) at the base of a cliff or very steep rock slope; the accumulated mass of such loose, broken rock formed mainly by falling, rolling, or sliding.

Taxadjuncts. Soils that cannot be classified in a series recognized in the classification system. Such soils are named for a series they strongly resemble and are

designated as taxadjuncts to that series because they differ in ways too small to be of consequence in interpreting their use and behavior. Soils are recognized as taxadjuncts only when one or more of their characteristics are slightly outside the range defined for the family of the series for which the soils are named.

Temperature regime, soil. A system that categorizes for taxonomic purposes general, long-term soil temperature conditions at the standard depth of 20 inches or at the surface of the bedrock, whichever is shallower. The various regimes are defined according to the freezing point of water or to the high and low extremes for significant biological activity. The regimes, which are defined in "Keys to Soil Taxonomy," are as follows:

Pergellic.—Soils that have a mean annual temperature of less than 32 degrees F and have permafrost.

Cryic.—Soils that have a mean annual temperature of 32 to 47 degrees F and remain cold in summer.

Frigid.—Soils that have a mean annual temperature similar to that of the cryic regime but have a mean summer temperature at least 9 degrees warmer.

Mesic.—Soils that have a mean annual temperature of 47 to 59 degrees F, and the difference between the mean summer and mean winter temperature is more than 9 degrees.

Thermic.—Soils that have a mean annual temperature of 59 to 72 degrees F, and the difference between the mean summer and mean winter temperature is more than 9 degrees.

Hyperthermic.—Soils that have a mean annual temperature of more than 72 degrees F, and the difference between the mean summer and mean winter temperature is more than 9 degrees.

Tephra. A collective term for any and all clastic materials, regardless of size or composition, ejected from a vent during a volcanic eruption and transported through the air. Includes volcanic ash (less than 2 millimeters in size), volcanic blocks (more than 64 millimeters in size), volcanic cinders (more than 2 millimeters in size), lapilli (a size of 2 to 76 millimeters and specific gravity of more than 2.0), pumice (a size of more than 2 millimeters and specific gravity of less than 1.0), and scoria (a size of more than 2 millimeters and specific gravity of less than 2.0).

Terminal moraine. An end moraine that marks the farthest advance of a glacier and commonly has the form of a massive arcuate or concentric ridge, or complex of ridges, underlain by till and other types of drift.

Terrace (geomorphologic). A steplike surface bordering a valley floor or shoreline that represents the former position of a flood plain, lake, or seashore. The term is commonly applied to both the relatively flat summit surface (tread) that has been cut or built up by stream or wave action and the steeper descending slope (scarp or riser) that grades to a lower base level of erosion. Practically, terraces are considered to be generally flat alluvial areas above the 100-year flood stage.

Texture, soil. The relative proportions of sand, silt, and clay particles in a mass of soil. The basic textural classes, in order of increasing proportion of fine particles, are *sand, loamy sand, sandy loam, loam, silt loam, silt, sandy clay loam, clay loam, silty clay loam, sandy clay, silty clay,* and *clay*. The sand, loamy sand, and sandy loam classes may be further divided by specifying "coarse," "fine," or "very fine."

Thermic temperature regime. See Temperature regime, soil.

Till. Unsorted, nonstratified glacial drift consisting of clay, silt, sand, gravel, cobbles, stones, and boulders transported and deposited by glacial ice.

Toeslope. The outermost inclined surface at the base of a hill; part of a footslope.

Topsoil. The upper part of the soil, which is the most favorable material for plant growth. It is ordinarily rich in organic matter and is used to topdress roadbanks, lawns, and land affected by mining.

Trace elements. Chemical elements, for example, zinc, cobalt, manganese, copper, and iron, in soils in extremely small amounts. They are essential to plant growth.

Tuff. A generic term for any consolidated or cemented deposit that is 50 percent volcanic ash (less than 2 millimeters in size). Various types of tuff can be recognized by their composition; acidic tuff is dominantly acidic particles and basic tuff is dominantly basic particles.

Ultramafic rock. An igneous rock composed chiefly of dark mafic (ferromagnesian) minerals. Common forms include rocks with a high content of magnesium and iron, such as talc-schist, serpentinite, peridotite, and various partially serpentinized rocks.

Umbric epipedon. A thick, dark, humus-rich surface horizon (or horizons) that has base saturation of less than 50 percent and pedogenic soil structure. It may include the upper part of the subsoil.

Unified soil classification. A system for classifying mineral and organic soils for engineering purposes based on particle-size characteristics, liquid limit, and plasticity index.

Upland (geomorphologic). A general term for the higher land of a region in contrast to the low-lying, adjacent land, such as a valley or plain; land at a higher elevation than the flood plain or low stream terrace; or land above the footslope zone of the hillslope continuum.

Valley. An elongated, relatively large, externally drained depression that formed primarily through stream erosion or glacial activity.

Valley fill. The unconsolidated sediment deposited by any agent (water, wind, ice, or mass wasting) that fills or partly fills a valley.

Vegetative cover. The crown cover of all live plants in relation to the ground surface.

Vernal pool. A shallow surficial depression that is temporarily filled with water during periods of rain in winter and spring and is desiccated during the dry summer months. It occurs as a small poorly drained depression. Water perches above an impermeable or very slowly permeable soil horizon, a duripan, or bedrock.

Very deep soil. See Depth, soil.

Very shallow soil. See Depth, soil.

Very stony soil material. Material that has 35 to 50 percent stones, by volume.

Water bars. Smooth, shallow ditches or depressional areas that are excavated at an angle across a sloping road. They are used to reduce the downward velocity of water and divert it off and away from the road surface. Water bars can easily be driven over if constructed properly.

Water table. The upper surface of ground water or the level below which the soil is saturated by water. Also, the top of an aquifer.

Weathering. All physical and chemical changes produced in rocks or other deposits at or near the earth's surface by atmospheric agents. These changes result in disintegration and decomposition of the material.

WEG. See Wind erodibility group.

Well graded. Refers to soil material consisting of coarse grained particles that are well distributed over a wide range in size or diameter. Such soil normally can be easily increased in density and bearing properties by compaction. Contrasts with poorly graded soil.

Wilting point (or permanent wilting point). The moisture content of soil, on an ovendry basis, at which a plant (specifically a sunflower) wilts so much that it does not recover when placed in a humid, dark chamber.

Wind erodibility group (WEG). A group of soils that have similar properties affecting their resistance to wind erosion in cultivated areas.

Windthrow. The uprooting and tipping over of trees by the wind.

Xeric moisture regime. The typical moisture regime in areas of Mediterranean climates, where it is moist and cool in winter and warm and dry in summer. When potential evapotranspiration is at a minimum, the moisture, which falls in winter, is particularly effective in leaching. The mean annual soil temperature is less than 22 degrees C, and the difference between the mean summer and mean winter soil temperature is 6 degrees.

Xerophytic. Pertaining to vegetation that is adapted to dry areas.

* A growing degree day is a unit of heat available for plant growth. It can be calculated by adding the maximum and minimum daily temperatures, dividing the sum by 2, and subtracting the temperature below which growth is minimal for the principal crops in the area (50 degrees F).

Table 2.--Freeze Dates in Spring and Fall

(Recorded in the period 1971-2000 at Chico Experimental Station; Strawberry Valley; Oroville; De Sabla; and Paradise, California. Absence of an entry indicates that data are not available)

Table 4.--Acreage and Proportionate Extent of the Soils

(Some map units from adjacent survey areas have been added to the soil legend for this survey area so that the mapping joins across survey area boundaries. Letters have been added at the end of the map symbols for these map units. The letters "co" refer to Colusa County, the letters "su" refer to Sutter County, and the letters "yu" refer to Yuba County)

Map symbol	Map unit name	Acres	Percent
100	Anita-Galt complex, 0 to 3 percent slopes	434	*
104	Bosquejo clay, 0 to 1 percent slopes	8,624	0.9
105	Busacca clay loam, 0 to 1 percent slopes	5,831	0.6
108	Tuscan-Igo-Anita complex, 0 to 3 percent slopes	1,058	0.1
109	Bosquejo clay loam, 0 to 1 percent slopes	789	*
110	Bosquejo silt loam, 0 to 1 percent slopes, overwash, occasionally flooded	213	*
111yu	Auburn-Sobrante complex, 8 to 15 percent slopes	158	*

Table 5.--Land Capability Classification

(The land capability system groups soils primarily on the basis of their ability to produce the commonly grown cultivated crops and pasture plants over a long period of time without deteriorating. Absence of an entry indicates that no land capability classification is assigned. N represents nonirrigated areas, and I represents irrigated areas)

Map symbol and soil name	Land capability	
	N	I
100:

521	Neerdobe silt loam, 0 to 1 percent slopes, overwash
528	Neerdobe clay loam, 0 to 1 percent slopes

Table 8.--Storie Index

(The California Storie Index expresses numerically the relative degree of suitability of a soil for general intensive agricultural uses at the time of evaluation. The rating is based on soil characteristics only and is obtained by evaluating such factors as soil depth, texture of the surface soil, subsoil characteristics, and surface relief. The ratings shown are for soils that are used to produce the commonly grown crops or for livestock grazing)

Map symbol and soil name	Storie index	Storie grade
100:		
Anita clay	3	Grade six - nonagricultural
Galt clay	10	Grade five - very poor
104:		
Bosquejo clay	35	Grade four - poor
105:

Farwell clay loam, rarely flooded----------	75	Grade two - good
176:		
Farwell loam, occasionally flooded----------	79	Grade two - good
177:		
Farwell silt loam, occasionally flooded----------	79	Grade two - good
178:		
Arbuckle gravelly loam----------	71	Grade two - good
179:		
Moda taxadjunct loam----------	14	Grade five - very poor
Arbuckle gravelly loam----------	71	Grade two - good
180:		
Dodgeland silty clay loam, occasionally flooded--	43	Grade three - fair
181:		
Dodgeland silty clay loam, frequently flooded----	43	Grade three - fair
189:		
Esquon silt loam, overwash----------	49	Grade three - fair
200:		
Parrott silt loam, occasionally flooded----------	83	Grade one - excellent
201:		
Parrott silt loam, frequently flooded----------	65	Grade two - good
203:		
Kusalslough silty clay loam, occasionally flooded	62	Grade two - good
205:		
Parrott silt loam, frequently flooded----------	65	Grade two - good
Vermet silt loam, frequently flooded----------	34	Grade four - poor

Table 8.--Storie Index--Continued

Map symbol and soil name	Storie index	Storie grade
220:		
Esquon clay, frequently flooded	24	Grade four - poor
Clear Lake silty clay loam, overwash	31	Grade four - poor
248yu:		
Trainer loam	69	Grade two - good
250:		
Llanoseco, occasionally flooded	63	Grade two - good
252:		
Whitecabin silty clay, occasionally flooded	26	Grade four - poor
Ordferry silty clay, occasionally flooded	10	Grade five - very poor
255:		
Whitecabin silty clay loam, occasionally flooded	44	Grade three - fair
Ordferry silty clay, occasionally flooded	10	Grade five - very poor
256:		
Whitecabin silt loam, occasionally flooded	49	Grade three - fair
257:		
Llanoseco, frequently flooded	53	Grade three - fair
258:		
Codora, occasionally flooded	62	Grade two - good
260:		
Ordferry silty clay, occasionally flooded	10	Grade five - very poor
280:		
Columbia taxadjunct stratified very fine sandy loam	49	Grade three - fair
290:		
Perkins gravelly loam	53	Grade three - fair
300:		
Redsluff gravelly loam	52	Grade three - fair
301:		
Wafap gravelly loam	24	Grade four - poor
Hamslough clay	5	Grade six - nonagricultural
302:		
Redtough loam	11	Grade five - very poor
Redswale cobbly loam	4	Grade six - nonagricultural
303:		
Munjar gravelly loam	21	Grade four - poor

Redtough loam	11	Grade five - very poor
Fallager loam	5	Grade six - nonagricultural
Anita, gravelly duripan	2	Grade six - nonagricultural
609:		
Anita, gravelly duripan	3	Grade six - nonagricultural
Tuscan taxadjunct gravelly clay loam	15	Grade five - very poor
675:		
Clearhayes sandy clay loam	55	Grade three - fair
Hamslough clay	15	Grade five - very poor
677:		
Tuscan gravelly loam	23	Grade four - poor
Fallager loam	22	Grade four - poor
Anita, gravelly duripan	9	Grade six - nonagricultural
685:		
Bosquejo taxadjunct gravelly substratum	34	Grade four - poor
686:		
Redsluff taxadjunct clay loam	80	Grade two - good

Table 9.--Hydric Soils

(This table lists the map units in the survey area that include hydric soils. Only the hydric components are shown. The (C) component, and the (I) indicates a minor component. See text for an explanation of the hydric criteria codes)

Map symbol and map unit name	Component/ local phase	Hydric status	Local landform	Hydric criteria (code)	Farmable condition	Pct. of map unit	Altere
100:							
Anita-Galt complex, 0 to 3 percent slopes	(C) Anita clay	Hydric	drainageways and depressions on fan terraces	2B3,3	Neither wooded nor farmable under natural conditions	60	
	(C) Galt clay	Hydric	drainageways and depressions on fan terraces	2B3,3	Farmable under natural conditions	25	
	(I) Bosquejo clay	Hydric	drainageways and depressions on fan terraces	3	Farmable under natural conditions	0-3	
	(I) Soils that are frequently ponded for long periods	Hydric	vernal pools on fan terraces	3	Neither wooded nor farmable under natural conditions	0-2	
	(I) Anita taxadjunct clay	Hydric	toeslopes on volcanic ridges	2B3,3	Neither wooded nor farmable under natural conditions	0-2	
	(I) Soils that have a gravelly duripan	Hydric	fan terraces	3	Neither wooded nor farmable under natural conditions	0-2	
104:							
Bosquejo clay, 0 to 1 percent slopes	(I) Galt clay	Hydric	fan terraces	3	Farmable under natural conditions	0-3	
	(I) Edjobe silty clay	Hydric	flood basins	3	Farmable under natural conditions	0-1	
105:							
Busacca clay loam, 0 to 1 percent slopes	(I) Edjobe silty clay	Hydric	flood basins	3	Farmable under natural conditions	0-5	

Table 9.--Hydric Soils--Continued

Map symbol and map unit name	Component/ local phase	Hydric status	Local landform	Hydric criteria (code)	Farmable condition	Pct. of map unit	Altere
108:							
Tuscan-Igo-Anita complex, 0 to 3 percent slopes	(C) Anita clay	Hydric	depressions and swales on fan terraces	2B3,3	Neither wooded nor farmable under natural conditions	15	
118:							
Xerorthents, tailings, 0 to 50 percent slopes	(C) Xerorthents, tailings	Hydric	stream terraces and flood plains	4	Wooded under natural conditions	80	Flood-con reduced n frequency Drainage ditches h depth to ditches, urban con modified patterns, depth, fr
	(I) Soils that are in riparian areas	Hydric	flood plains	4	Wooded under natural conditions	0-5	
	(I) Water-filled pits	Hydric	flood plains	4	Neither wooded nor farmable under natural conditions	0-5	
	(I) Xerofluvents, tailings	Hydric	flood plains	4	Neither wooded nor farmable under natural conditions	0-3	
	(I) Xeropsamments, tailings	Hydric	flood plains	4	Neither wooded nor farmable under natural conditions	0-3	
	(I) Soils that have a duripan	Hydric	edges of terraces	4	Neither wooded nor farmable under natural conditions	0-2	

Table 9.--Hydric Soils--Continued

Map symbol and map unit name	Component/ local phase	Hydric status	Local landform	Hydric criteria (code)	Farmable condition	Pct. of map unit	Altere
118co:							
Clear Lake clay, 0 to 2 percent slopes, frequently flooded	(C) Clear Lake clay, frequently flooded	Hydric	flood basins	2B3,4	Farmable under natural conditions	90	Flood-con reduced n frequency Drainage ditches h depth to ditches, urban con modified patterns, depth, fr
	(I) Willows silty clay, frequently flooded	Hydric	flood basins	2B3,4	Farmable under natural conditions	0-6	
	(I) Clear Lake clay, occasionally flooded	Hydric	flood basins	2B3,4	Farmable under natural conditions	0-2	
	(I) Soils in channels	Hydric	channels	4	Wooded under natural conditions	0-2	
119:							
Xerorthents, tailings-Urban land complex, 0 to 2 percent slopes	(C) Xerorthents, tailings	Hydric	terraces and flood plains	4	Wooded under natural conditions	70	Flood-con reduced n frequency Drainage ditches h depth to ditches, urban con modified patterns, depth, fr

* Annual production is given in cubic feet per acre per year at the age of culmination of the mean annual i

Table 11a.--Forestland Management

(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. Only the soils for which site index productivity information is available are listed. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Map symbol and soil name	Pct. of map unit	Potential for damage to soil by fire		Potential for seedling mortality	
		Rating class and limiting features	Value	Rating class and limiting features	Value
165yu:

Table 11b.--Forestland Management

(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. Only the soils for which site index productivity information is available are listed. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Table 11c.--Forestland Management

(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. Only the soils for which site index productivity information is available are listed. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Map symbol and soil name	Pct. of map unit	Suitability for mechanical site preparation (surface)		Suitability for mechanical site preparation (deep)

Table 11d.--Forestland Management

(The information in this table indicates the dominant soil condition but does not eliminate the need for onsite investigation. Only the soils for which site index productivity information is available are listed. The numbers in the value columns range from 0.01 to 1.00. The larger the value, the greater the limitation. See text for further explanation of ratings in this table)

Table 13.--Index of Common and Scientific Plant Names and Plant Symbols

(This table aids in correct plant identification and serves as a cross-reference to plant species listed in table 12. The plant synonymy as reported in the USDA-NRCS National Plants Database at the time of publication is used)

Local common name	Scientific name	Plant symbol
Alameda County thistle	Cirsium quercetorum	CIQU2
alpine timothy	Phleum alpinum	PHAL2
annual lupine	Lupinus bicolor	LUBI
Arizona cypress	Cupressus arizonica	CUAR
arnica	Arnica spp.	ARNIC
arroyo willow	Salix lasiolepis	SALA6
athel	Tamarix articulata	TAAR3
Bailey acacia	Acacia baileyana	ACBA
baldcypress	Taxodium distichum	TADI2
barbed goatgrass	Aegilops triuncialis	AETR
beardless wildrye	Leymus triticoides	LETR5
beggartick (sticktights)	Bidens frondosa	BIFR
bermudagrass	Cynodon dactylon	CYDA
big saltbush	Atriplex lentiformis	ATLE
bigleaf maple	Acer macrophyllum	ACMA3
bitter cherry	Prunus emarginata	PREM
bitterbrush	Purshia spp.	PURSH
black walnut	Juglans nigra	JUNI
blackberry	Rubus spp.	RUBUS
blue elderberry	Sambucus nigra ssp. cerulea	SANIC5
blue oak	Quercus douglasii	QUDO
blue wildrye	Elymus glaucus	ELGL
bluedicks	Dichelostemma capitatum ssp. capitatum	DICAC5
bluegrass	Poa spp.	POA
bluestars	Brodiaea minor	BRMI3
bottlebrush squirreltail	Elymus elymoides	ELEL5
broadleaf starflower	Trientalis borealis ssp. latifolia	TRBOL
brodiaea	Brodiaea spp.	BRODI
brome	Bromus spp.	BROMU
buckbrush	Ceanothus cuneatus	CECU
buckwheat	Eriogonum spp.	ERIOG
bulrush	Scirpus ssp.	SCIRP
burclover	Medicago hispida	MEHI
butter-n-eggs	Triphysaria eriantha ssp. eriantha	TRERE2
buttercup	Ranunculus spp.	RANUN
calicoflower	Downingia spp.	DOWNI
California black oak	Quercus kelloggii	QUKE
California blackberry	Rubus ursinus	RUUR
California buckeye	Aesculus californica	AECA
California buckthorn	Frangula californica ssp. californica	FRCAC5
California buckthorn	Frangula californica ssp. tomentella	FRCAT2
California false hellebore	Veratrum californicum var. californicum	VECAC2
California hazel	Corylus cornuta var. californica	COCOC
California honeysuckle	Lonicera hispidula	LOHI2
California laurel	Umbellularia californica	UMCA
California needlegrass	Achnatherum occidentale ssp. californicum	ACOCC
California red fir	Abies magnifica	ABMA
California redbud	Cercis orbiculata	CEOR9
California scrub oak	Quercus dumosa	QUDU
California sycamore	Platanus racemosa	PLRA
California torreya	Torreya californica	TOCA
California walnut	Juglans californica	JUCA
California wild grape	Vitis californica	VICA5
California wildrose	Rosa californica	ROCA2
canyon live oak	Quercus chrysolepis	QUCH2
carex	Carex spp.	CAREX
cattail	Typha spp.	TYPHA
chamise	Adenostoma fasciculatum	ADFA

Table 13.--Index of Common and Scientific Plant Names and Plant Symbols--Continued

Local common name	Scientific name	Plant symbol
chapparal coffeeberry	Frangula californica	FRCA12
cheatgrass	Bromus tectorum	BRTE
checkerbloom	Sidalcea spp.	SIDAL
Chinese pistache	Pistacia chinensis	PICH4
chokeberry	Photinia spp.	PHOTI
clover	Trifolium spp.	TRIFO
club moss	Lycopodium cernuum	LYCE
cocklebur	Xanthium ssp.	XANTH2
columbine	Aquilegia spp.	AQUIL
common buttonbush	Cephalanthus occidentalis	CEOC2
common snowberry	Symphoricarpos albus	SYAL
common yarrow	Achillea millefolium	ACMI2
cottonwood	Populus spp.	POPUL
cowbag clover	Trifolium depauperatum	TRDE
coyote thistle	Eryngium castrense	ERCA33
coyote willow	Salix exigua	SAEX
coyotebrush	Baccharis pilularis	BAPI
creeping sage	Salvia sonomensis	SASO
curly dock	Rumex crispus	RUCR
dallisgrass	Paspalum dilatatum	PADI3
dandelion	Taraxacum spp.	TARAX
deerbrush	Ceanothus integerrimus	CEIN3
deergrass	Muhlenbergia rigens	MURI2
dogwood	Cornus spp.	CORNU
Douglas sagewort	Artemisia douglasiana	ARDO3
Douglas-fir	Pseudotsuga menziesii	PSME
eucalyptus	Eucalyptus spp.	EUCAL
fescue	Festuca spp.	FESTU
fiddleneck	Amsinckia spp.	AMSIN
filaree	Erodium spp.	ERODI
Fitch's spikeweed	Hemizonia fitchii	HEFI
flatspine stickweed	Lappula occidentalis var. occidentalis	LAOCO
foothill pine	Pinus sabiniana	PISA2
forsythia	Forsythia spp.	FORSY
fourwing saltbush	Atriplex canescens	ATCA2
foxtail fescue	Festuca megalura	FEME
Fremont cottonwood	Populus fremontii	POFR2
Fremont's deathcamas	Zigadenus fremontii	ZIFR
Fremont's tidytips	Layia fremontii	LAFR2
golden willow	Salix alba var. vitellina	SAALV
goldfields	Lasthenia spp.	LASTH
greenleaf manzanita	Arctostaphylos patula	ARPA6
hackberry	Celtis occidentalis	CEOC
hairgrass	Deschampsia	DESCH
hairypink	Petrorhagia dubia	PEDU2
Hansen's spikemoss	Selaginella hansenii	SEHA2
hardstem tule	Scirpus acutus var. occidentalis	SCACO4
hayfield tarweed	Hemizonia congesta ssp. luzulifolia	HECOL3
hedgehog dogtail	Cynosurus echinatus	CYEC
Himalaya blackberry	Rubus discolor	RUDI2
hollyleaf cherry	Prunus ilicifolia	PRIL
huckleberry oak	Quercus vacciniifolia	QUVA
incense cedar	Calocedrus decurrens	CADE27
interior live oak	Quercus wislizeni	QUWI2
iris	Iris spp.	IRIS
Italian ryegrass	Lolium perenne ssp. multiflorum	LOPEM2
Jeffrey pine	Pinus jeffreyi	PIJE
Jepson ceanothus	Ceanothus jepsonii	CEJE
Johnsongrass	Sorghum halepense	SOHA
junegrass	Koeleria macrantha	KOMA
larkspur	Delphinium spp.	DELPH
leather oak	Quercus durata	QUDU4
Lemmon ceanothus	Ceanothus lemmonii	CELE

Table 13.--Index of Common and Scientific Plant Names and Plant Symbols--Continued

Local common name	Scientific name	Plant symbol
lodgepole pine	Pinus contorta	PICO
lupine	Lupinus spp.	LUPIN
manzanita	Arctostaphylos spp.	ARCTO3
mariposa lily	Calochortus spp.	CALOC
meadow barley	Hordeum brachyantherum	HOBR2
meadowfoam	Limnanthes spp.	LIMNA
Mediterranean barley	Hordeum murinum ssp. leporinum	HOMUL
medusahead	Taeniatherum caput-medusae	TACA8
miners lettuce	Claytonia perfoliata	CLPE
mint	Mentha spp.	MENTH
monkeyflower	Mimulus spp.	MIMUL
mountain alder	Alnus viridis ssp. crispa	ALVIC
mountain brome	Bromus marginatus	BRMA4
mountain misery	Chamaebatia foliolosa	CHFO
mouse barley	Hordeum marinum ssp. gussonianum	HOMAG
mulberry	Morus spp.	MORUS
mullein	Verbascum spp.	VERBA
mustard	Brassica spp.	BRASS2
navarretia	Navarretia spp.	NAVAR
nitgrass	Gastridium ventricosum	GAVE3
oak	Quercus spp.	QUERC
oleander	Nerium oleander	NEOL
olive	Olea europaea	OLEU
orchardgrass	Dactylis glomerata	DAGL
Orcutt brome	Bromus orcuttianus	BROR2
Oregon ash	Fraxinus latifolia	FRLA
Pacific dogwood	Cornus nuttallii	CONU4
Pacific madrone	Arbutus menziesii	ARME
Pacific poison oak	Toxicodendron diversilobum	TODI
pepperweed	Lepidium spp.	LEPID
pinemat manzanita	Arctostaphylos nevadensis	ARNE
pink escallonia	Escallonia laevis	ESRU4
pipsissewa	Chimaphila umbellata	CHUM
plantain	Plantago spp.	PLANT
pomegranate	Punica granatum	PUGR2
ponderosa pine	Pinus ponderosa	PIPO
popcornflower	Plagiobothrys	PLAGI
prickly lettuce	Lactuca serriola	LASE
prostrate ceanothus	Ceanothus prostratus	CEPR
purple clarkia	Clarkia purpurea	CLPU2
purple needlegrass	Nassella pulchra	NAPU4
Pursh's buckthorn	Frangula purshiana	FRPU7
ragweed	Ambrosia spp.	AMBRO
rattlesnake brome	Bromus briziformis	BRBR5
red brome	Bromus rubens	BRRU2
red clover	Trifolium pratense	TRPR2
redbud	Cercis spp.	CERCI2
ripgut brome	Bromus diandrus	BRDI3
Rocky Mountain maple	Acer glabrum	ACGL
rose clover	Trifolium hirtum	TRHI4
rush	Juncus spp.	JUNCU
Russian olive	Elaeagnus angustifolia	ELAN
ryegrass	Lolium spp.	LOLIU
saltgrass	Distichlis ssp.	DISTI
Scotch broom	Cytisus scoparius	CYSC4
scrub oak	Quercus berberidifolia	QUBE5
shootingstar	Dodecatheon spp.	DODEC
shrub tanoak	Lithocarpus densiflorus var. echinoides	LIDEE
Sierra chinquapin	Chrysolepis sempervirens	CHSE11
Sierra coffeeberry	Frangula rubra ssp. rubra	FRRUR
Sierra currant	Ribes nevadense	RINE
Sierra gooseberry	Ribes roezlii	RIRO

Table 13.--Index of Common and Scientific Plant Names and Plant Symbols--Continued

Local common name	Scientific name	Plant symbol
Sierra mock stonecrop	Sedella pumila	SEPU4
silver hairgrass	Aira caryophyllea	AICA
soap plant	Chlorogalum spp.	CHLOR3
soft blow wives	Achyrachaena mollis	ACMO2
soft chess	Bromus hordeaceus ssp. hordeaceus	BRHOH
spikerush	Eleocharis spp.	ELEOC
squirreltail	Elymus elymoides ssp. californicus	ELELC2
starry false Solomons seal	Maianthemum stellatum	MAST4
sticky whiteleaf manzanita	Arctostaphylos viscida	ARVI4
sugar pine	Pinus lambertiana	PILA
swampgrass	Crypsis schoenoides	CRSC
tall Oregon grape	Mahonia aquifolium	MAAQ2
tanoak	Lithocarpus densiflorus	LIDE3
tarweed	Hemizonia spp.	HEMIZ
thistle	Cirsium spp.	CIRSI
toyon	Heteromeles arbutifolia	HEAR5
valley oak	Quercus lobata	QULO
vetch	Vicia spp.	VICIA
vinegarweed	Trichostema lanceolatum	TRLA4
violet	Viola spp.	VIOLA
wavyleaf Indian paintbrush	Castilleja applegatei	CAAP4
wax currant	Ribes cereum	RICE
western brackenfern	Pteridium aquilinum	PTAQ
western princes pine	Chimaphila umbellata ssp. occidentalis	CHUMO2
western thimbleberry	Rubus parviflorus	RUPA
wheatgrass	Agropyron spp.	AGROP2
white alder	Alnus rhombifolia	ALRH2
white brodiaea	Triteleia hyacinthina	TRHY3
white fir	Abies concolor	ABCO
white meadowfoam	Limnanthes alba ssp. alba	LIALA
